

GamiFi exchange links

Historical source edition | 7 September 2026

Public crypto research edition. The following material preserves historical analysis, source identifiers, transaction amounts and stated qualifications. Observations retain their original dates, principally 5-7 September 2026. Preparing this edition did not repeat the blockchain, corporate-registry or legal research.

Read each assertion with its cited source and limits. A public role, a wallet connection or a valid transaction does not by itself identify a human operator, prove personal receipt or establish wrongdoing. The reports distinguish findings, interpretations and unanswered questions.

Correction precedence: the 7 September 2026 ShibaFriend claims review reports repayment of the principal of all 23 non-dust funding addresses, with only 168 base units of dust unmatched. It also reports equal project matches for all 194 identified paid Mystery Box mints. Those later findings supersede earlier uncertainty about those specific questions. See [Research_Paper_ShibaFriend_Claims_Review.pdf](#).

Original source-page labels and reference identifiers are retained where useful. Gaps in numbering reflect the crypto-only scope. Historical references to companion records are locators; consult the repository inventory to see which records are included. Current availability of an external source is not guaranteed.

GamiFi: the exchange links

New evidence: changed stake-return and reward rules, retained administrative powers, another 160 BNB deposited into Tornado Cash, and further Binance and Bitkub links. The prior exchange census and April privacy-pool route are retained; sections 20-32 document this continuation.

New finding	Verified result
Actual rule changes	Existing ID6 stake-return opening delayed three days in March 2022. May 2023 pool edits shortened reward periods and eased new withdrawal timing; both pools were then below recorded principal.
Persistent control	An April 2022 upgrade added delegated administration. The original deploying address retained that role after operational ownership changed, and exercised funding/configuration powers.
More linked funds	LP redemption and seven GMI sales precede another 160 BNB in privacy-pool deposits. An exact bridge match reaches Ethereum; later funds enter a Safe through a mixed-fund wallet.
Exchange endpoints	A commonly funded 30-wallet trading cohort consolidates to e467, linked onward to Binance. The additional 2129 branch carries 16,999.94257-17,000 USDT of f4 funding to Bitkub.

The strongest concerns are the withdrawal mechanism, actual changes affecting existing deposits, retained powers, and coordinated trading/funding patterns. Public transfers establish routes and control addresses; authorization and credited customers require records.

Updated 7 September 2026. BNB Smart Chain and a separately identified Ethereum branch; all times UTC. Values at successive hops must not be added into a loss total. This report distinguishes transaction evidence, source-code effects, published disclosures and unresolved attribution.

LATEST CONTINUATION - pages 38-43
KuCoin and OKX connections; Binance withdrawal candidates; resolved gas funding; wider Tornado scans and note-exclusion tests. See sections 33-38.

NEW CONTINUATION - sections 39-49, pages 44-54
Gate / Bybit / ONUS paths, more Binance routes, exact bridge joins, shared Safe owners and recovered histories.

1. The shared depositing wallet

The newly recovered [10,000-GMI transfer](#) links f4f8 directly to the MEXC intermediary. The four Bitkub-bound payments come from that same f4f8 address. This establishes a common depositing wallet; service account ownership is a separate question. The new native payment [1f88 to f4f8](#) adds a direct connection between the two source wallets, beyond their shared exchange destination.

Other verified sources supplied the MEXC intermediary: private beneficiary 3604...b4d4 sent 18m GMI; early distribution/vesting funder e696...63c9 sent 500,000; a575...fba5 sent 200,000. Together with the two sources shown above, the 16 identified incoming transfers total 140.51m GMI.

The diagram shows selected relationships. The stablecoin totals are commingled and are not all attributed to GamiFi token sales. The FixedFloat extraction route is shown separately on page 7.

2. MEXC: all 15 outgoing transactions

140,510,000 GMI moved from 9564...d464 to two MEXC-disclosed wallets between 24 January 2022 and 21 January 2023. Nonces 0-14 are all recovered, matching the observed sender count of 15.

UTC	GMI	Destination	Receipt
2022-01-24 11:24:22	500,000	4982...89cb	Open receipt
2022-05-04 09:54:09	200,000	4982...89cb	Open receipt
2022-05-18 04:07:07	3,300,000	2e8f...5e64	Open receipt
2022-05-21 05:39:06	3,500,000	2e8f...5e64	Open receipt
2022-05-27 02:09:09	25,000,000	2e8f...5e64	Open receipt
2022-06-23 21:00:14	200,000	4982...89cb	Open receipt
2022-06-23 21:03:08	19,800,000	2e8f...5e64	Open receipt
2022-07-29 22:01:07	5,000,000	2e8f...5e64	Open receipt
2022-07-29 22:06:07	50,000,000	2e8f...5e64	Open receipt
2022-08-04 14:21:11	10,000,000	2e8f...5e64	Open receipt
2022-08-06 14:33:06	5,010,000	2e8f...5e64	Open receipt
2022-11-04 15:00:29	5,000,000	2e8f...5e64	Open receipt
2022-11-08 17:48:21	5,000,000	2e8f...5e64	Open receipt
2022-12-08 02:27:14	5,000,000	2e8f...5e64	Open receipt
2023-01-21 02:34:05	3,000,000	4982...89cb	Open receipt

Destination totals: **136,610,000 GMI to 2e8f** and **3,900,000 GMI to 4982**. The 11 earlier transfers total 122.51m GMI; the four later private-beneficiary sweeps total 18m.

This completes sender 9564 through nonce 14. The additional, separately verified MEXC intermediary 86b and its 611,885.287967005235959843-GMI collection appear in section 16. Earlier source and collection amounts are retained without counting the same transfer twice.

3. MEXC: funding sources reconcile

Sixteen identified incoming transfers from five source wallets total **140,510,000 GMI**, exactly matching the 15 outgoing transfers. These identified flows reconcile; their business purposes and credited accounts remain open.

Source wallet	GMI	Observed role
0x1f88...a62b	121,800,000	Treasury funding source
0x3604...b4d4	18,000,000	Private beneficiary
0xe696...63c9	500,000	Early distribution / vesting funder
0xa575...fba5	200,000	Unassigned source
0xf4f8...b1d7	10,000	Also sends into Bitkub route

The strongest treasury connection

The source 1f88 sent **121.8m GMI** into this exchange route. On 14 September 2022 it also supplied **315,429,687.025769235288817275 GMI** to replenisher 9490...ea88. The earlier investigation identified 47.02m GMI in seven pool-refill payments from that replenisher. [Large replenisher funding](#).

MEXC arrival date	GMI from 1f88	Delay	Linked legs
2022-05-27	25,000,000	36 sec	In / Out
2022-06-23	200,000	180 sec	In / Out
2022-06-23	19,800,000	168 sec	In / Out
2022-07-29	5,000,000	111 sec	In / Out
2022-07-29	50,000,000	111 sec	In / Out

These five pairs total 100m GMI and their incoming receipts agree with an independent Binance endpoint. They are a subset of the 121.8m source total. Do not add them again.

The 6 August 5.01m-GMI sweep combines a 5m deposit from 1f88 with the preceding 10,000-GMI payment from f4f8 on 5 August. The intermediary held zero GMI after its 4 August and 6 August sweeps; the intervening incoming-log windows locate both payments.

4. Bitkub: collection and gas links

f4f8 sent **25,906.285983337104699148 USDT and 6,590 BUSD** to ba4d...bf53. Each of four selected payments was followed by an exact-amount sweep into a Bitkub-labelled wallet; ba4d had zero relevant token balance before each incoming payment and after its sweep.

Sweep UTC	Asset / quantity	Destination	Receipt
2022-10-21 10:58:28	USDT 19436.285983337104699148	Bitkub 4	Sweep
2022-10-21 19:41:17	USDT 60	Bitkub 4	Sweep
2022-12-07 02:33:57	BUSD 6590	Bitkub 12	Sweep
2022-12-07 02:35:34	USDT 6410	Bitkub 4	Sweep

New during the original event: at 02:34:12 on 7 December 2022, 9be7...095a sent **0.000824524656 BNB** to ba4d. That was 15 seconds after the BUSD sweep and 82 seconds before the 6,410-USDT sweep. [Gas funding receipt](#). BscScan labels 9be7 [Bitkub: Deposit Funder](#). Two providers agree on the transfer and receipt.

Same infrastructure on Ethereum

UTC date	ETH	Observed direction
2022-07-26	0.035	9be7 -> ba4d / Receipt
2024-10-11	0.007	c488 -> ba4d / Receipt
2024-10-11	0.120428606076488771	ba4d -> db04 / Receipt
2024-10-14	0.005828704240572093	c488 -> ba4d / Receipt
2026-05-07	0.006089169127184628	ba4d -> db04 / Receipt

The July 2022 payment predates the BSC deposits. Explorer labels identify c488 as Bitkub Deposit Funder 3 and db04 as Bitkub Hot Wallet 1. All five selected Ethereum transactions have successful receipts from one provider. The later ETH transfers corroborate infrastructure use; they are not established GamiFi proceeds.

Inference: the repeated gas funding and collection pattern strongly supports exchange-operated deposit infrastructure. Historical customer assignment to ba4d still requires Bitkub records.

Expanded review completed: all 209 normal outgoing transactions of ba4d are now verified, including the 205 previously unexamined. The four selected project-related payments above remain a subset. Full intermediary totals, Binance source links and evidence boundaries appear on pages 11-13.

5. BUSD: the outgoing gap is closed

Nine BUSD payments from private beneficiary 3604...b4d4 reached f4f8 before its 7 December 2022 Bitkub-bound payment. Their total is **4,621.182065779058717490 BUSD**.

UTC date	BUSD from private beneficiary	Receipt
2022-11-06	1703.881799387599741069	Transfer
2022-11-19	244.51637024993160388	Transfer
2022-11-24	263.867721787667042029	Transfer
2022-11-24	500.96031074041888508	Transfer
2022-11-24	376.431633899894859871	Transfer
2022-11-24	290.463375480966450319	Transfer
2022-12-01	806.075000858219228005	Transfer
2022-12-06	194.26331405038374757	Transfer
2022-12-07	240.722539323977159667	Transfer

Known inputs and complete outgoing coverage

Component	Exact BUSD
Opening balance at block 22,767,121	0.099999999999999999
Nine private-beneficiary payments	4,621.182065779058717490
Three identified conversion outputs	1,968.790624559216318459
Payment to ba4d	-6,590
Closing balance at block 23,688,417	0.072690338275035948

Retry completed: all 93 outgoing Transfer-event windows, covering blocks 22,767,122-23,688,417, returned successfully. Exactly one positive-value outgoing BUSD event was found: the [6,590-BUSD payment to ba4d](#). The filter includes transfers made through third-party allowances. No other positive BUSD payment appears in this interval. One [zero-value event](#) names a lookalike recipient; a different sender submitted it. It changes no balance and is excluded.

Under ordinary token transfer accounting, the nine payments from wallet 3604 contribute **4,621.109375440783681542-4,621.182065779058717490 BUSD** to that payment. The lower end subtracts the entire 0.072690338275035948-BUSD remainder from those receipts; the upper end subtracts none. This is a fungible-balance accounting range, not legal title, customer identity or proof of theft. Incoming receipts were verified individually; the complete incoming history was not separately enumerated.

6. FixedFloat: the extraction proceeds

On 5 November 2022, 44m GMI removed from the three staking/vesting contracts was sold for **5,174.293394005109506048 BUSD**. Seller 35dc...5422 sent **5,174 BUSD** into the route below. [Sale receipt](#).

UTC, 5 Nov 2022	Movement	Receipt
07:15:11	35dc -> 96f0: 5,174 BUSD	Deposit
07:15:20	4727 -> 96f0: 0.00084 BNB for gas	Gas
07:15:32	96f0 -> 4727: 5,174 BUSD	Sweep
07:15:41	96f0 -> 4727: 0.000502984 BNB remainder	Remainder

The same service-associated address supplied the gas and collected both tokens and leftover BNB. Four fresh Binance receipts agree with the prior archive captures. This supports a service collection workflow.

The extraction and sale also share an operational link: transaction submitter 343c...235e submitted the 44m removal and then funded seller 35dc with **0.019849782233850894 BNB** at 06:45:39, before the sale. [Seller gas funding](#).

Current boundary: BSC block 120,417,619, 7 September 2026 at 02:52:11 UTC. Deposit intermediary 96f0 has exactly two normal outgoing transactions and zero BNB/BUSD; both transactions are identified. Seller 35dc has three normal outgoing transactions and retains 0.293394005109506048 BUSD. Neither address has sent a normal Ethereum transaction at the checked Ethereum block 25,922,617.

Attribution and the missing payout

The [BscScan label](#) and a [10 May 2025 administrator-attributed address statement](#) support the FixedFloat association. The later statement is not a historical 2022 customer/order confirmation. FixedFloat describes an [order-based exchange flow](#). A uniquely attributable output asset, chain or payout address was not recovered.

7. Exchange records and public roles

MEXC has two distinct documented connections

Wallet infrastructure: MEXC identified 4982 as its BSC withdrawal address in its [12 July 2021 statement](#). Its [wallet-address disclosure](#) names both 4982 and 2e8f on BSC. That indexed page displays a creation date of 13 December 2022; it may have been updated later. It is not an archived 2022 snapshot.

Public project relationship: MEXC announced [GMI trading for 25 January 2022 at 13:00 UTC](#), with deposits already open. Its [23 February 2022 AMA recap](#) features Laura Walsh and Casey McQuillan promoting GamiFi. These are direct promotional/listing links. The available material does not name the owner of the credited exchange account.

Record holder	Identifiers and question
MEXC	Intermediary 9564; all 15 arrival hashes on page 3; 16 incoming payments from five sources. Confirm historical address assignment, credited account(s), authorized users, listing/liquidity arrangements, trades and later withdrawals. Include January-August 2022.
Bitkub	Intermediary ba4d; all 209 outgoing hashes, 218 positive token inputs, and the four original f4f8 deposit hashes. Confirm historical address assignment, credited accounts, authorized users, trades and withdrawals. Preserve the 2022-2024 records; the current self-service API history window is only 90 days.
Historical FixedFloat operator	5 November 2022 deposit/sweep hashes, 5,174 BUSD, intermediary 96f0. Confirm historical custody and any order, output asset/network, payout transaction or refund.
Project custodians	Assignments and mandates for 1f88, f4f8, 3604, withdrawal signer/Safe and transaction submitter 343c. Reconcile the deposits to allocations, liquidity, invoices and other documented obligations.

Coverage and unresolved questions

The MEXC normal sender inventory is complete through nonce 14. The f4f8 BUSD outgoing interval is complete across all 93 windows. The ba4d inventory is now complete through nonce 208, and all 218 indexed positive token inputs and 64 native funding transactions have been checked against node records. Initial and final BNB/USDT/BUSD balances reconcile exactly. Explorer incoming-history coverage is not a separate exhaustive all-block log census.

Customer identities, credited balances, trades and later withdrawals remain unresolved. These are records questions, not a remaining 205-transaction gap. Bitkub's [current deposit-history API](#) documents a 90-day history window. No exchange was contacted and no on-chain transaction was submitted.

8. Treasury funds the common depositor

A direct native-asset link now connects treasury source 1f88 to the common MEXC/Bitkub depositor f4f8. Both final treasury transactions after the known September migration have been recovered: nonces 31 and 32.

UTC date / time	Movement	BNB	Receipt
2022-09-14 11:00:35	1f88 -> replenisher 9490	1	Receipt
2022-12-06 10:36:05	f4f8 -> treasury 1f88	0.017368951262722757	Receipt
2022-12-06 11:01:31	1f88 -> depositor f4f8	2.002	Receipt

The September 1-BNB payment followed the 315,429,687.025769235288817275-GMI migration to the same replenisher. This adds a native funding leg to the previously verified token-funding relationship.

The December sequence

After receiving 0.017368951262722757 BNB from f4f8, treasury source 1f88 sent 2.002 BNB back 25 minutes 26 seconds later. Its gas fee for that outgoing payment was 0.000105 BNB. The smaller incoming payment is described as a payment; its specific purpose has not been established.

Ninety-nine seconds after the 2.002 BNB arrived, f4f8 made its next normal outgoing transaction: [5 BNB converted into 1,428.0263153399440365 BUSD](#). This BUSD receipt is one of the three conversion outputs in the page 6 reconciliation, before the next-day 6,590-BUSD payment toward Bitkub.

The wallet contained other funds. The full 5 BNB and the full conversion output are not assigned exclusively to the 2.002-BNB treasury receipt. The verified conclusion is a direct treasury funding link and the exact subsequent conversion sequence.

Verification and limits

The treasury sender history is now complete: 33 outgoing transactions comprise 24 successful GMI payments, two successful BNB payments and seven failed contract calls. Failed call amounts are excluded from transfer totals. Full GMI and BNB accounting reconcile. New predecessor and control-state links appear in sections 14-16; human key custody remains unresolved.

9. The earlier MEXC funding source

On **18 January 2022 at 11:12:33 UTC**, original GMI mint recipient and token creator 0d2c...7dca sent **120,000,000 GMI** to e696...63c9. [Original distributor payment](#). Six days later, e696 supplied the 500,000-GMI deposit into the MEXC route.

This places the January MEXC source in the original token-distribution network. Its 120m receipt is separate from wallet 3604's later 120m vesting allocation and is not an additional 120m exchange deposit. Full e696 GMI and BNB accounting is now reconciled; its April sales and onward privacy-pool route appear in section 13.

Four vesting-funding operations on 18 January

UTC time	GMI funded	Beneficiary	Receipt
16:04:41	117647.0599999999993577472	0x11f2...3c6b	Receipt
16:04:47	29411.7599999999996329984	0xb6b4...e1c9	Receipt
16:04:53	12731.0599999999998820352	0x3bde...4946	Receipt
16:04:59	147058.8200000000010878976	0xa427...6b13	Receipt

Total funding: **306,848.6999999999999606784 GMI** into private vesting contract 74e0...df6c. Successful transaction inputs identify the four beneficiaries, a 90-day cliff and a 270-day linear period. The selected category value is 2; no human ownership category is assigned to that value.

The preserved contract code makes this funding function public. Calling it establishes a funding operation; it does not establish administrator status. All five newly linked transfer logs agree with independent Binance receipts.

Beneficiary addresses

[0x11f2e9d3a8e9c652b075829a95faca14eeb93c6b](#)

[0xb6b47cd9d4abbf09166a774aba04ec8bea14e1c9](#)

[0x3bde03f8d779cd70fd987dedb243688ffbea4946](#)

[0xa427f5c2e796a6e8bee5eba1a53c308c424f6b13](#)

The e696 and a575 sender histories are now complete through nonces 23 and 36. Both include four reverted transactions. Their GMI and BNB accounts reconcile exactly. Original deployer 0d2c funded e696; prior project-payment recipient 35b1 funded a575. New sales, privacy-pool deposits, funding and MEXC links follow in sections 13-16.

10. Bitkub: every outgoing transaction checked

209 of 209 transactions verified; all 205 previously unexamined transactions are resolved.

The node records contain the complete sender sequence 0-208. Each successful transaction calls the genuine USDT or BUSD token contract; its recipient and amount match the receipt event.

Asset	Count	Collection address	Exact total
USDT	206	5615...e2f3 / Bitkub 4	20,590,671.348562172805598323
BUSD	3	c68c...e1e9 / Bitkub 12	11,590

First outgoing: **16 July 2022, 12:34:34 UTC** ([Receipt](#)). Last outgoing: **6 August 2024, 11:03:12 UTC** ([Receipt](#)). The pinned 7 September 2026 sender count is still 209. Every decoded token-transfer recipient is one of the two collection addresses above; no normal BNB payment leaves ba4d.

The newly examined portion comprises **203 USDT transfers totaling 20,564,765.062578835700899175 USDT**, plus **two BUSD transfers totaling 5,000 BUSD**. These amounts describe intermediary activity and are not assigned to GamiFi.

The incoming side and gas reconcile

All **218 positive USDT/BUSD incoming events** from the recovered explorer history were independently receipt-verified. Their totals equal the outgoing totals exactly. USDT and BUSD balances are zero both immediately before the first indexed receipt and at the pinned endpoint.

BNB accounting	Exact BNB
64 verified incoming payments, all from Bitkub-labelled funder 9be7	0.0373679541808
Gas consumed by all 209 outgoing transactions	0.0366465287544
Verified remaining balance	0.0007214254264

The USDT collection address 5615 also appears, by exact address and BSC network, in the current [Bitkub reserve disclosure](#). Bitkub's [official shareholder letter](#) links that exchange-reported disclosure. The c68c attribution remains an explorer label; no equivalent exact exchange disclosure was recovered for it.

The evidence ZIP includes BITKUB_ALL_209_OUTGOING_TRANSACTIONS.csv with each nonce, time, hash, asset, amount, recipient and project-attribution scope. No normal outgoing transactions remain missing at the stated endpoint.

11. Binance wallets feed the Bitkub route

Five direct source addresses match the BSC/BEP20 list in Binance's [Our Commitment To Transparency](#). The article states first publication on 10 November 2022 and an update on 9 October 2023. The cited table identifies these wallets at BSC height 22,920,346.

Binance-disclosed source address	Count	USDT into ba4d	Link
0xe2fc31f816a9b94326492132018c3aecc4a93ae1	30	4,429,234.38	Example
0xa180fe01b906a1be37be6c534a3300785b20d947	36	3,521,952.55	Example
0xeb2d2f1b8c558a40207669291fda468e50c8a0bb	27	3,470,237.1896	Example
0x8894e0a0c962cb723c1976a4421c95949be2d4e3	27	2,996,170.44610557	Example
0xbd612a3f30dca67bf60a39fd0d35e39b7ab80774	2	41,682.12	Example

Combined: **14,459,276.68570557 USDT in 122 receipt-verified events**, approximately **70.22%** of the intermediary's examined USDT inputs. These are source-wallet links; neither exchange's credited or withdrawing customer is identified.

A concrete two-source collection on 20 December 2022

UTC time	Verified movement	USDT	Receipt
11:36:30	Binance-disclosed e2fc -> ba4d	455,222.71	Receipt
17:26:01	Binance-disclosed eb2d -> ba4d	50,000.71	Receipt
17:27:43	ba4d -> Bitkub collection 5615	505,223.42	Receipt

The two inputs sum exactly to the outgoing transfer. Historical USDT balance calls confirm zero immediately before the first input and after the sweep. This illustrates the exchange route; it is not an additional GamiFi transaction or loss figure.

All 35 incoming source addresses were compared with the 16 BSC addresses in the cited Binance disclosure. Exactly five matched. The other addresses remain unattributed by that comparison; the disclosure is not a complete list of every Binance wallet.

12. Project subset, exclusions and open records

The broader ba4d turnover is not a GamiFi loss estimate. Its four direct f4f8 receipts remain 25,906.285983337104699148 USDT and 6,590 BUSD. The additional ff040 route in section 17 is separate: it raises the identified f4-origin USDT total across the two examined Bitkub paths to 31,879.815744658531463810 USDT. No exchange customer or payment purpose is assigned.

The two additional BUSD collections

A different source, [22b6...fee7](#), sent 10 and 4,990 BUSD on 11 November 2022. Both amounts were forwarded to c68c the next day:

BUSD	Input on 11 November	Sweep on 12 November
10	14:11:06 UTC	04:07:25 UTC
4,990	14:29:28 UTC	04:34:23 UTC

A bounded check of four earlier 22b6 transactions found liquidity-withdrawal activity involving USDC/BUSD, USDT/BUSD and WBNB/BUSD, and a separate 300,000-BUSD payment. No GMI asset appears in those selected records. The full intervening balance history was not reconstructed, so the later 5,000 BUSD is not assigned exclusively to those liquidity proceeds or to GamiFi.

False trails removed from the money totals

The 615-event explorer history contains **94 zero-value events in the genuine USDT/BUSD contracts** and **94 events from other token contracts**. Neither group is included in the USDT/BUSD payment totals, and none belongs to the 209 normal transactions sent by ba4d. Four small positive genuine-USDT receipts remain included in the accounting.

One unrelated-contract event shows the same **19,436.285983337104699148** amount as a known project-related payment. The [independent receipt](#) confirms a different token contract and a different transaction sender. It is not an additional USDT outflow. Actor identity and intent are unassigned.

What remains to establish

The unresolved questions are historical deposit-address assignment, credited accounts, withdrawal customers, key custody, authorization and business purpose. Gas top-ups and consolidation sweeps are consistent with routine exchange operations. They do not turn all activity at a shared deposit address into project proceeds.

Coverage: 209 normal outgoing transactions are complete at the pinned block. All indexed positive inputs are receipt-verified and endpoint balances reconcile. The 615-event incoming/token history matches the explorer's reported total; a separate exhaustive all-block inbound log census was not run. Earlier incomplete scan files remain preserved as superseded attempts.

13. GMI sales feed the Tornado Cash route

Four successful swaps on 27-28 April 2022 sold 102,344,817.9300000000000393216 GMI for 1,048.456700160480855245 BNB. Seller 82f had received 33,333,333.33 GMI directly from e696; e696 originally received 120m GMI from the token creator. The 82f allocation is part of that 120m, not a second allocation.

UTC, 2022	Seller	GMI sold	BNB received	Link
27 Apr 23:53:24	82f	28,333,333.33	536.357104816631222167	Receipt
28 Apr 00:59:25	e696	24,011,484.6000000000000393216	228.591034921729184853	Receipt
28 Apr 01:01:46	e696	20,000,000	126.998886664701559825	Receipt
28 Apr 01:19:40	e696	30,000,000	156.5096737574188884	Receipt

Both sellers funded [d676...be17](#). The 82f payment of 537.354950490763970008 BNB followed its sale by 18 seconds ([Receipt](#)). The two e696 payments totaled 513.008289048145461281 BNB. Those native payments include pre-existing or separately supplied BNB.

d676 collection sequence, UTC	Deposits	BNB
27 Apr 23:57:00-23:57:24; after 82f funding	5 x 100 BNB	500
28 Apr 01:04:04-01:04:34; after first e696 input	3 x 100 BNB	300
28 Apr 01:20:49-01:20:58; after second e696 input	2 x 100 BNB	200
28 Apr 02:10:53-02:11:32	5 x 10 BNB	50

All 15 outgoing nonces 0-14 succeeded. Each receipt contains a Deposit event from the exact Tornado Cash 100-BNB or 10-BNB pool, matching the proxy input and commitment. A [100-BNB deposit](#) occurred 39 seconds after the first e696 input. The proxy and pools also match the [official protocol configuration](#).

Exact d676 accounting: 1,050.363239538909431289 BNB received = 1,050 BNB deposited + 0.068667195 BNB gas + 0.294572343909431289 BNB remaining. Starting and ending balances were independently queried. Both sellers' sale receipts were also confirmed by historical BNB balance changes.

Investigative significance: substantial original-distribution GMI was converted to BNB and the sellers funded a privacy-pool deposit route. The entire 1,050 BNB is not assigned exclusively to GMI sale proceeds. Deposits alone do not identify later withdrawals, note holders or criminal intent. The evidence CSV lists all 15 deposits.

14. Contract control and its funding links

Historical state confirms the public owner change and the later private proxy-admin change below. Sections 20 and 28 add the September owner handovers and demonstrate that earlier delegated public powers survived them. The November private-admin change is separate from the November 5 staking/Launchpool withdrawal mechanism.

UTC date / time	Contract and role	Verified change	Link
5 May 2022 10:36:16	56c0...6c7f Public-fund owner	78d09...14c3 -> 14cc...b412	Receipt
7 Nov 2022 14:04:32	74e0...df6c Private-claim proxy admin	78d09...14c3 -> f27f...c27b	Receipt

Successful transaction inputs and OwnershipTransferred / AdminChanged events agree with archive reads immediately before and after each change. The proxy check uses the admin storage location specified in [ERC-1967](#). An earlier 7 November call assigned 78d09 as admin to itself and is recorded separately.

Funding around the 7 November admin transfer

UTC time	Verified native payment	BNB	Link
13:09:59	78d09 -> f4, after earlier self-assignment	0.49975851	Receipt
14:04:14	35b1 -> 78d09; 18 sec before admin change	0.499895	Receipt
14:08:08	78d09 -> f4, after admin change	0.49963252	Receipt

The 0.5-BNB f4 payment before the earlier self-assignment is retained in the full native ledger. These payments connect the control-changing address to the common depositor and to funding address 35b1; payment timing does not identify a person or prove shared signing keys.

A further direct connection to the ownership recipient

On 6 December 2022 at 10:33:29 UTC, **14cc**, the exact address that received the public contract's owner role in May, sent **0.486254474681124665 BNB to f4** ([Receipt](#)). This precedes the already documented f4-to-treasury payment and 2.002-BNB treasury return later that morning.

Records to obtain: the key-custody and authorization records for 78d09, 14cc and f27f; the reasons for the ownership/admin changes; and who directed the contemporaneous funding payments. The verified findings establish control addresses at specific blocks, not the identity of their human operators.

15. One funding address links several trails

The exact address [0x35b119730f79881dac623dc51c831c6a04cab5f3](#) now links project-payment records, initial liquidity funding, an early MEXC source and the common exchange depositor. These are verified address relationships; the name of the account or key holder is unresolved.

Date / period	Verified relationship	Amount
23 Mar 2022	Public-fund contract 56c0 -> 35b1; project ID 4	2,000 BUSD
22 Jun 2022	56aa -> 35b1; ShibaFriend-associated payment	4,720.231567727363184247 BUSD
29 Nov 2021 / 10 Jan 2022	78d09 -> 35b1; two separate payments	47,000 BUSD
18 Jan 2022, 14:31:22	35b1 -> initial GMI liquidity wallet 82f	250,000 USDC
15 Apr-1 Jun 2022	35b1 -> early MEXC source a575; four payments	150 BNB
30 May 2022, 02:46:57	35b1 -> common depositor f4	20,000 BUSD
23 Sep 2022, 04:44:18	35b1 -> common depositor f4	2.99606819 BNB

The prior ID4 payment came directly from **56c0**, not from 56aa. The separate **47,000-BUSD** predecessor funding is also distinct from the ID4/ShibaFriend amounts. The evidence package includes the original receipts and a source register for these earlier relationships.

Initial liquidity funding

The [250,000-USDC receipt](#) was followed by conversion of that amount to **535.951519005132747841 BNB**. At 14:39:13, 82f created the GMI/WBNB pool using **5,000,000 GMI and 326 BNB** ([Receipt](#)). Liquidity creation is separate from the April sale and is not counted as sale proceeds.

The 20,000-BUSD payment into f4 was followed 9 minutes 39 seconds later by an equal payment to [f481...277b](#) ([Receipt](#)). That destination's customer, role and subsequent history remain unassigned in this review.

The 35b1 funding trail raises specific records questions about allocation purposes, settlement instructions and custody. Shared funding and project participation do not, by themselves, establish that all recipient wallets belong to one person.

16. Treasury origin and a new MEXC route

The treasury's incoming GMI is now linked through two predecessor addresses. All three payments below are receipt-verified. The first predecessor had intervening GMI activity, so the table records the address route without assigning exclusive unit provenance.

UTC date	Observed GMI movement	Exact GMI	Link
28 Mar 2022	Creator 0d2c -> 78d09	485,674,840.500000004985061376	Receipt
28 Apr 2022	78d09 -> 9afcd	454,433,340.025769235288817275	Receipt
28 Apr 2022	9afcd -> treasury 1f88	454,433,340.025769235288817275	Receipt

Treasury later sent **1,846,153 GMI to a575 on 1 June** ([Receipt](#)) and **1,500,000 GMI to 2cac on 9 June** ([Receipt](#)). The June a575 allocation cannot fund that wallet's earlier May MEXC deposit.

a575 -> 2cac -> 86b -> MEXC

12 October 2022 UTC	GMI movement	Exact GMI
04:44:35 / 04:45:53	2cac -> 86b; two inputs	575,863.886638775774212202
04:46:41	bb5f -> 86b; separate input	36,021.401328229461747641
04:49:08	86b -> MEXC 498	611,885.287967005235959843

The **MEXC GMI sweep** combines the three inputs exactly. The intermediary also received 0.005 BNB from MEXC and 4.173343173320423114 BNB from 2cac. After gas, **4.176890253320423114 BNB** was swept to MEXC. All seven unique route transactions and zero opening/ending balances are verified.

Precise source boundary: 2cac had zero GMI after its 9 June distribution, independently confirmed at block 18,538,209. The later cycle received 6m GMI exclusively from a575. Thus **575,863.886638775774212202 GMI** in this MEXC collection traces to that later a575 cycle. The remaining 36,021.401328229461747641 GMI came from bb5f; its intervening history remains unexamined.

The selected 2cac window balances 7.83m GMI in and out, including 5.83m GMI across 43 payouts to 11 recurring recipients. Those distributions are detailed in the CSV. This additional MEXC route is separate from the previously counted 140.51m GMI sent by intermediary 9564.

17. A second Bitkub path from the common depositor

Another **5,973.529761321426764662 USDT** from **f4** reached **Bitkub** collection address **5615** through intermediary **ff040**. Both pairs were recovered with a focused archive log scan; all four historical USDT balances were zero immediately before and after the pairs.

16 May 2023 UTC	Verified movement	Exact USDT	Link
09:59:56	f4 -> ff040	4,953.618728852575164662	Receipt
10:01:59	ff040 -> Bitkub 5615	4,953.618728852575164662	Receipt
10:11:50	f4 -> ff040	1,019.9110324688516	Receipt
10:13:38	ff040 -> Bitkub 5615	1,019.9110324688516	Receipt

Collection delays were **123 seconds** and **108 seconds**. Four zero-value events to lookalike addresses were excluded. The ff040 intermediary also receives native funding from the same Bitkub-labelled funder as ba4d; the exact onward sweeps supply the decisive same-chain link.

Combined identified f4-origin USDT across ba4d and ff040: **31,879.815744658531463810 USDT**. The prior 6,590-BUSD ba4d route remains separate. These are deposits originating at the project-connected f4 address, not a finding that every token represents project revenue or unauthorized spending.

The new Bitkub deposits share a sender with MEXC withdrawals. The next section reconciles the MEXC-funded portion of an earlier Bitkub-bound payment, including the other funds present in f4.

The f4 normal sender census is complete through nonce 213: 214 outgoing transactions, including five reverted calls. All 20 indexed normal BNB inputs and ten selected additional token-input transactions were also verified. The full 384-event token index is preserved, with the independently checked subset identified explicitly.

18. MEXC withdrawals fund an earlier Bitkub payment

MEXC-disclosed wallet 498 sent f4 **18,547.99164551 USDT across seven payments** and **4,655,245.59 GMI across two payments**. All nine receipts are verified. Five of the USDT payments form the following bounded route into the already documented October Bitkub deposit.

UTC date / time, 2022	MEXC 498 -> f4, USDT	Link
20 Oct 16:45:07	4,344.1978094	Receipt
20 Oct 16:54:10	3,757.51899863	Receipt
21 Oct 08:58:05	7,666	Receipt
21 Oct 09:26:07	1,347.39070983	Receipt
21 Oct 10:37:10	88.9198	Receipt

At 10:45:55 on 21 October, f4 sold **905,913.02 GMI for 152.258665477104699148 USDT** ([Receipt](#)). At 10:56:43 it sent **19,436.285983337104699148 USDT to ba4d**, the previously verified Bitkub intermediary ([Receipt](#)).

USDT accounting across this interval	Exact USDT
Verified opening balance before first MEXC receipt	2,080
Five MEXC USDT receipts	17,204.02731786
Separate GMI conversion output	152.258665477104699148
Payment from f4 to ba4d	-19,436.285983337104699148
Verified closing balance	0

All seven positive USDT events in the indexed interval are receipt-verified. Archive balances at blocks 22,344,071 and 22,365,753 reconcile exactly. A rate-limited closing-balance request was retried successfully as a single call; the failed response remains preserved.

This establishes a MEXC -> f4 -> Bitkub funding route, including the separately identified opening stock and GMI conversion. It does not identify the MEXC withdrawing customer, the Bitkub credited customer, or what trading occurred inside either exchange. This is source accounting for the previously counted payment, not an additional deposit.

19. Infrastructure and remaining records

The four large previously unattributed ba4d funding wallets are now connected through additional funding and collection relationships. These service patterns help locate exchange records; they do not assign the entire intermediary turnover to GamiFi.

New relationship	Evidence and interpretation
Four sources -> ff040	All four source wallets pay the intermediary independently linked to f4 and Bitkub 5615.
Sources -> c47a / 9cda	Representative genuine-USDT sweeps lead onward to Bitkub 5615. Same-chain receipts support these links.
f6e7 -> 48c6 -> Binance	Eight f6e7 inputs total 999,900.004499 USDT; representative onward sweeps reach Binance-disclosed 8894.
3cb / d226 / ed7d funding	22 verified BNB funding payments connect 21 earlier ba4d source wallets. Human control remains unassigned.

The additional 2129 branch is now linked to Bitkub

The three f4 payments totaling **17,000 USDT** into [2129...63fe](#) are followed through three collectors to Bitkub in section 29. Historical balances bound the f4-origin component at 16,999.94257-17,000 USDT. Earlier 15,000/20,000-BUSD payments into cbf3/f481 remain open.

Coverage completed in this update

Address / window	What was independently verified
Treasury 1f88	33 outgoing nonces; 26 succeeded and seven reverted.
Early e696 / a575 / 82f	24 / 37 / 18 outgoing nonces; exact GMI/BNB accounts.
Common depositor f4	214 outgoing nonces; 20 normal inputs and 10 other selected inputs.
New d676 / 86b intermediaries	15 / 2 outgoing nonces; relevant inputs and balances verified.
2cac, June-October window	53 GMI events; 7.83m in/out; zero balance boundaries.
Four ba4d funding sources	220 outgoing nonces; 199 token payments, 20 native payments, one failed attempt.

The evidence distinguishes recovered explorer histories from independently checked receipts; no exhaustive all-block inbound census is claimed for the wider network. Reverted transactions are excluded from money totals. Failed reads are preserved with successful retries.

Sections 24-27 now examine 9fa4 and later LP handling, including a defined trading sample, native consolidation, another privacy-pool route and an Ethereum bridge. Post-Tornado withdrawals, wider lifetime trading, key custody, customer records and authorization remain unresolved.

20. Changed schedules and retained powers

An existing stake-return opening was delayed, and an upgrade later preserved earlier operators' powers after ownership transfers. These are demonstrated contract changes, beyond a change in the owner-address label.

17 March 2022: ID6/GAMI	Verified before / after
Claim-back opening	17 Mar 11:25:06 -> 20 Mar 11:26:54 UTC; block 16,136,661 -> 16,222,560. Delay: 3 days, 1 minute, 48 seconds.
State before the 10:20:17 setter	515,000 GMI staked; 26,761.141280969119319108 BUSD funded. Schedule setter

The setter preceded the old opening by 1 hour 4 minutes 49 seconds. Exact source/runtime and historical project settings show that claimBack uses this mutable block. This delay predates the April sale/privacy-pool route; it does not establish that those later sales caused the change.

5 April: the owner role ceased to be the only operational authority

UTC	Action	Link
08:38:51	Upgrade adds delegated admins; project creation, configuration and funding withdrawal become admin-or-owner.	Receipt
08:41:24	Deployer 3e0 grants itself admin=true.	Receipt
11:26:12	Operational owner transfers 3e0 -> 78d09.	Receipt

The role survived the May and September owner transfers. At block 120,444,752, **operational owner=f27f; delegated admin=3e0; public ProxyAdmin 7ece owner=78d09**. Earlier admin 3e0 also created projects, changed schedules and withdrew project funding after the May handover. All three public implementations compile to their exact complete deployed runtimes.

A separate receiver change also matters: on 23 March at 14:56:37, ID4's funding receiver changed 8fea -> 35b1 after 2,000 BUSD had been funded; the 2,000-BUSD withdrawal followed 90 seconds later. [Receiver setter](#). Purpose, authorization and investor notification remain records questions.

21. How the November GMI removal worked

The November 5 record shows deliberate contract-level preparation for a 44m-GMI removal. A temporary implementation granted the exact withdrawal Safe maximum token allowances; restoring the original implementations left those allowances in place. This mechanism was established in the preceding investigation and is integrated here with the new authority findings.

5 November 2022 UTC	Verified action	Link
06:14:38	Temporary implementations grant GMI allowance to withdrawal Safe 9362; original implementations restored.	Receipt
06:45:09	Safe uses transferFrom: 23m GMI from large pool, 14m from Launchpool, 7m from small pool; 44m total.	Receipt
06:51:21	44m GMI sold for 5,174.293394005109506048 BUSD.	Receipt
07:15:11	5,174 BUSD of sale proceeds forwarded to 96f0.	Receipt
07:15:32	96f0 sweeps the same 5,174 BUSD to FixedFloat-associated 4727.	Receipt

Why the allowance matters

The ordinary staking emergency-withdrawal calculation protected recorded principal. The prior adjacent-state analysis found no ordinary withdrawable excess in the large pool and about 284,516 GMI in the small pool. The allowance route let a separate Safe remove 23m and 7m GMI while recorded obligations remained. The spender address explicitly authorized in the preparation transaction is the same address that later pulled the tokens.

The shared upgrade administrator 6ef changed owner 3e0 -> 538a on 4 November and 538a -> Safe 6bf early on 5 November. This concerns the staking/Launchpool proxies; public 56c0 uses 7ece. The private 74e0 administrator change on 7 November occurred later and cannot explain this earlier removal.

The downstream service here is FixedFloat-associated infrastructure, separate from the April/July Tornado routes. Later pool refills and withdrawals alter the eventual shortfall: 44m removed is a transaction amount, not a permanent unrecovered-loss calculation. The preserved original captures document the preparation, allowance persistence and balances.

22. May 2023: reward rules actually changed

On 9 May 2023, f27f shortened both staking pools to cutoff times already in the past. This stopped further reward accrual and advanced the pool-end gate for requesting principal back. Later that day the same address removed the 24-hour waiting period for new requests.

Pool / duration setter	Old end -> new end, 2023 UTC	Link
Small ba3063 11:57:32	21 May 12:00:00 -> 9 May 11:32:40	Receipt
Large ee57 11:58:44	19 Aug 12:00:00 -> 9 May 11:31:30	Receipt

The new ends precede their setters by 24m 52s and 27m 14s. Source `_calReward` caps accrual at the new end; uncheckpointed accrual in those short intervals could also be affected. No user-specific reward loss is quantified. Already transferred rewards and separately stored pending rewards are not clawed back by these setters.

9 May UTC	Pending request delay	Link
17:49:14; small pool	86,400 seconds -> 0	Receipt
17:50:05; large pool	86,400 seconds -> 0	Receipt

The zero delay applies to new reward-claim and unstake requests. Request and subsequent claim/unstake calls remain necessary; existing requests retain their stored unlock timestamps. The edits eased timing, while available assets remained a separate problem.

At the delay-edit blocks	GMI assets	Recorded principal	Shortfall, GMI
Small ba3063	28,662,869.195227	38,622,960.532563	9,960,091.337336
Large ee57	60,196,619.961189	96,376,842.216506	36,180,222.255317

Table rounded to 6 decimals; exact raw values are preserved. These are historical principal deficits before unpaid rewards, not current balances or proof every individual withdrawal failed. A permitted request does not establish the pool could pay everyone.

Fresh before/after getters, all four successful receipts and block headers agree. The implementation is 4e9f at all eight boundaries; its 7,239-byte historical runtime exactly matches preserved Sourcify on-chain and compiled bytes. [Public source](#). No recovered investor agreement establishes consent to these particular edits.

23. What changed in public disclosures

Contract rules changed; the recovered general-terms page did not change substantively across its three captured dates. These are different records and should not be collapsed into one claim about rewritten terms.

Public record	Documented difference	Dating / limit
Fair Launch Notice	Initial blacklist/token-freeze horizon: first few hours. Later wording extends it to the foreseeable future; initial 1% fee paragraph removed.	Original 18 Jan 2022. Revised metadata 14 Mar; revised body first captured 27 Jun. No actual freeze established by wording alone.
Initial staking article	Adds warning: locked/staked GMI cannot count toward IDO participation; additional GMI required.	3 Feb: absent 13:16:04; present 14:42:31. Disclosure addition; no contract mutation inferred.
New pool launch/open articles	60/90-day pool maxima: 1.5m each -> 6m/3.4m GMI. APYs and durations unchanged.	Original bodies 4 May. Revised metadata 7 May; first revised captures 27 Jun.
General platform terms	Substantive body identical; copyright footer 2022 -> 2023. All display revision 25 Jan 2022.	Captures 7 Oct 2022, 24 Mar 2023, 4 Oct 2023. Earliest actual capture is October; printed revision alone does not prove earlier publication.

The three general-terms bodies have the same normalized SHA-256. Fresh October 2022/2023 archive retrievals reproduce the recovered original captures. This supports a bounded no-change result for those snapshots, not a claim that terms never changed.

Project announcements supply additional context

On 29 June 2022, the ShibaFriend IDO cancellation attributed difficulty to repeated tokenomics/release-schedule changes and offered SHF from a private allocation plus 1,000 GMI, or a refund. That concerns SHF specifically. The 3 October IDO pause and quieter-communications announcement did not explicitly suspend GMI staking withdrawals or authorize the November removal.

Sources: [Fair Launch Notice](#); [initial staking](#); [pool launch](#); [pool open](#); [ShibaFriend cancellation](#); [October update](#); [October 2022 terms capture](#). Capture dates, bodies, hashes and diffs are indexed in `terms_comparison.json`.

24. LP redemption to another 160 BNB in pools

The LP-token branch is now traced through redemption, seven GMI sales and seven Tornado deposits. Wallet 82f sent the original LP tokens to [3f963...559d](#) on 26 July 2022 (LP transfer).

26 July 19:16:15 UTC redemption	Exact amount
LP tokens burned	40,373.258476372699138973
GMI returned	37,905,741.088307672990198554
BNB returned	149.416984524612079818
Seven later GMI sales: all returned GMI sold	104.818395856200820155 BNB received

The [successful burn receipt](#) verifies the assets delivered to 3f963. A failed removal and failed sale are excluded. Returned liquidity BNB and sale BNB mix in that wallet; the entire 160-BNB deposit total is not assigned exclusively to the sales.

27 July 2022 UTC	BNB deposited	Receipt
06:19:00	10	Receipt
06:32:18	10	Receipt
06:32:39	10	Receipt
06:37:36	10	Receipt
08:48:29	100	Receipt
08:48:50	10	Receipt
08:49:14	10	Receipt

Every deposit input and pool Deposit event agrees with the official Tornado BSC proxy and 10/100-BNB pool addresses retained in section 13. Together with April's 15 deposits, this is **22 distinct verified deposit transactions totaling 1,210 BNB gross**. This is a deposit sum, not unique project loss or a trace through private withdrawals.

All 26 outgoing nonces were checked: 24 succeeded, 2 reverted. Including inputs, 28 transactions were receipt/header verified. Historical native and tracked-token boundaries reconcile; final BNB, GMI and LP balances are zero. Wrapped-BNB unwrapping includes intermediate conversions and is not additional income. A separate ETH bridge route follows.

25. Exact bridge match reaches Ethereum

The bridge receiving transaction contains the exact BSC source hash. This provides a stronger link than an amount/time coincidence. The downstream trail reaches a Safe through a wallet containing other funds; no exchange label is established for that Safe.

27 July 2022 UTC	Verified bridge leg	Link
18:21:09, BSC	3f963 bridges 15.7265 pegged ETH through Multichain/Anyswap; destination chain 1 and recipient same 3f963.	Receipt
18:22:13, Ethereum	Same 3f963 receives 15.7105 native ETH via unwrap/internal transfer. Source hash matches both receiving calldata and LogAnySwapIn.	Receipt
18:33:54, Ethereum	3f963 -> f731: 15.709470110573056 ETH; remaining difference is transaction gas.	Receipt

The bridge interval is 64 seconds. Source amount minus delivered amount is 0.016 ETH; this report does not assign a fee explanation without protocol settlement records. Both initial Ethereum sender histories reconcile to zero from their complete indexed native activity.

28 July UTC	Observed downstream activity	Link
10:05:38	f731 -> dd5217: 15.709344110573056 ETH.	Receipt
10:11:30	dd5217 swaps 77.6 ETH, including other funds, for 125,704.075705 USDC.	Receipt
10:13:41	dd5217 sends 125,704.075705 USDC to Safe 525a.	Receipt

The 77.6 ETH and 125,704.075705 USDC are mixed-fund transaction totals, not amounts assigned wholly to GamiFi. Safe 525a used a 4-of-6 threshold at receipt. Reconstructed historical owners and currently reported owners have no exact match with the ten compared BSC seller/control addresses; that bounded comparison neither identifies nor excludes a shared human operator.

Evidence strength: BSC source is independently node-verified. Ethereum receiving/downstream records use preserved Blockscout transaction, log and internal-transfer APIs, plus Safe service data; independent Ethereum RPC confirmation remained unavailable after failed endpoint attempts. The failure records are retained.

26. A commonly funded 30-wallet trading cohort

Common funding, synchronized approvals, cross-recipient swaps and common consolidation connect these 30 addresses operationally. Wallet 9fa4 received 2,371.64482308 BNB from liquidity wallet 82f and 8,333,333.33 GMI from original-distribution wallet e696.

Disperse batch, 18 January 2022 UTC	Each of the same 30 recipients	Link
14:54:44	17.91 BNB	Receipt
15:01:47	277,777.77 GMI	Receipt
15:04:32	79.03 BNB	Receipt

Each address receives **96.94 BNB + 277,777.77 GMI** in the same recipient order across all three batches: 2,908.2 BNB and 8,333,333.1 GMI total. Full calldata, 60 native internal payouts and 30 GMI transfer logs agree. Disperse executable bytecode was compared with its published implementation.

Observed behavior	Receipt-verified result
First outgoing approvals	All 30 have nonce 0; same GMI/router/fixed allowance of 1,000,000,000,000 GMI. Executed in two blocks at 14:57:29 and 14:57:32.
One successful buy and sale per wallet	90 selected receipts including approvals. 57 of 60 swaps direct output to another wallet inside the cohort: 28 buys and 29 sales. No outside output recipient in these 60.
Common collector e467	All 30 send BNB to e467: 32 payments totaling 15.578912833250967648 BNB. The final 30 occur within 24 seconds on 1 March 13:12:08-13:12:32.

Example: a [buy by b497](#) sends its output to cohort member 23f9. Buy/sale samples were selected separately; their labels do not imply each buy funded the selected sale. e467 had also received 666,666.66 GMI from e696 in January.

This is a concrete lead for coordinated trading, allocation purpose and market-making records. It does not establish manipulative intent, beneficial ownership or 30 independent traders. The complete address list and 124 selected trading/consolidation receipts are in the CSV/JSON evidence, with nine additional base 9fa4 transactions.

Scope is bounded: 6,000 indexed rows from the earliest/latest 100 per address, including 5,996 sender transactions. Pinned sender counts total 159,399 across the cohort. Intervening lifetime activity was not reconstructed. All 30 ending nonce checks and selected transaction retries succeeded.

27. Cohort collector links onward to Binance

The common collector **e467** sends onward through **b0c91** and **8be1** to **Binance-disclosed wallet 8894**. Each of the three payments below is independently verified from its full transaction, successful receipt, block header and historical sender balances.

2 March 2022 UTC	Route	Exact BNB	Link
00:37:06	0xe467...2779 -> 0xb0c9...2152	40.928889418145853079	Receipt
00:38:27	0xb0c9...2152 -> 0x8be1...e4cb	156.962177223432980728	Receipt
06:35:53	0x8be1...e4cb -> Binance 8894	166.961847113432980728	Receipt

The cohort's 32 payments into e467 totaled 15.578912833250967648 BNB. e467's onward 40.928889418145853079-BNB payment contains other balance as well. b0c91 and 8be1 also contain other inputs; their larger onward payments must not be assigned wholly to the cohort or added together as fresh proceeds.

Sender after selected transaction	Historical BNB result
e467	0; outgoing amount plus 0.000105 gas exhausts balance.
b0c91	0; outgoing amount plus 0.000105 gas exhausts balance.
8be1	0.006395 remains; final Binance payment is not a full sweep.

Service attribution is tied to the exact 8894 address appearing in the previously preserved official Binance reserve disclosure. This supplies an exchange endpoint for the collector's address route, while the credited account, withdrawal instructions and trading purpose remain unknown.

The same Binance-disclosed address also supplied 9fa4's initial 0.0195-BNB funding. Common exchange infrastructure cannot identify a shared customer; the more informative links are the common allocation, synchronized first approvals, cross-recipient trades and later consolidation.

The package preserves the 101-row e467 normal index, 132-row b0c91 index and 33-row 8be1 index. This new path verifies three selected receipts with independent review; it does not claim a transaction-by-transaction lifetime census for all three wallets. Exchange records should reference all three hashes, their dates and the final deposit address.

28. Coordinated ownership and treasury support

On 19 September 2022, 14cc transferred ownership of 15 distinct contracts to f27f within 26 minutes 9 seconds. The public 56c0 and private 74e0 handovers were part of this batch. The complete event list is retained in `CONTROLLER_OWNERSHIP_HANDOVER.csv`.

UTC / contract	Successful owner transfer	Link
09:37:41-10:03:50	15 distinct contracts: 14cc -> f27f.	Full CSV
09:46:38 / private 74e0	14cc -> f27f	Receipt
09:57:05 / public 56c0	14cc -> f27f	Receipt

Five days earlier, 14cc funded the treasury-connected staking replenisher 9490. The latter also received 315,429,687.025769235288817275 GMI from treasury 1f88 on 14 September, as established previously.

14 September 2022 UTC	14cc -> 9490	Link
08:04:56	100 USDC	Receipt
08:10:14	50,256.274293674825498827 USDC	Receipt
08:14:53	4,779.53864590269080348 BUSD	Receipt
08:16:32	100 BNB	Receipt

35b1 had funded 14cc with 3 BNB on 28 April and 390.50307622 BNB on 3 August. 14cc sent 203 BNB back across 3-4 August. This connects the ownership-changing address, shared project-payment address and staking replenisher through actual transfers; it does not establish a single key holder.

All 75 unique normal records across 14cc/f27f were transaction/receipt/header checked. 14cc has 59 outgoing nonces including one revert; f27f has 12, all successful. Both native ledgers reconcile exactly to their pinned balances. Contracts 3bba, c4ce and 7cd3 also appear in the 15-contract handover: earlier treasury transfers to these are not evidence of personal-wallet payments.

Private proxy administration was originally assigned to 78d09 on 28 March via d3b ([Receipt](#)). No private upgrade appears in its direct history or original administrator's bounded history. Public delegated and upgrade powers remain distinct from these owner handovers.

29. The additional 17,000-USDT Bitkub branch

All three 2129 routes now reach Bitkub 5615 through receipt-verified collectors. The f4-origin component is bounded at **16,999.94257-17,000 USDT**, preserving the small pre-existing April balance when attributing the input to the onward transfers.

2024 date	f4 input, USDT	Collector	First collection, USDT	Links
2024-04-29	10000	0xff04...03ab	10000	Input / Via / Collect
2024-08-19	3000	0xc47a...9393	3000.005562	Input / Via / Collect
2024-09-11	4000	0xdec5...c058	4000.004489	Input / Via / Collect

April 29: 10,000 USDT enters 2129 at 04:21:58; 10,000 goes to ff040 at 04:33:34 and to Bitkub at 04:35:34. 2129 starts and ends with 0.05743 USDT. Therefore 9,999.94257-10,000 USDT of the f4 input is attributable to that collection window. The collector itself starts and ends at zero.

August 19: 3,000 USDT enters 2129 at 15:27:44. At 15:29:05 it sends 3,000.005562 to c47; that same amount reaches Bitkub at 15:31:47. 2129 and the collector close at zero, so the complete 3,000-USDT f4 component passes through.

September: verify both sweeps, not just the matching amount

September 11: 4,000 USDT enters 2129 at 02:42:05. It sends 4,000.004489 to dec509 at 02:43:44. Another wallet then adds 7,557.442099 USDT to dec509 before the first Bitkub sweep, creating mixed funds.

September 11 UTC	dec509 -> Bitkub 5615, USDT	Link
02:45:29	4,000.004489	Receipt
02:46:50	7,557.442099	Receipt

Both inputs and both sweeps reconcile 11,557.446588 USDT to zero at block 42,148,577. The full 4,000-USDT f4 component therefore reaches Bitkub across the two sweeps; it cannot be assigned exclusively to the first sweep. The 0-0.05743 uncertainty in the combined figure is an April window bound, not a claim about funds currently outside Bitkub.

Evidence: 284-row normal index, 821 token events, 14 targeted transaction/receipt checks plus historical states and independent closure review. The entire 2129 turnover is not attributed to GamiFi. These collections add another exchange-record lead from f4; customer identity remains unresolved.

30. Evidence coverage and focused next records

The report now separates completed wallet censuses from selected route checks and samples. Reverted transactions are excluded from movement totals. Failed source/state requests remain preserved alongside successful retries; unavailable Ethereum RPC checks are explicitly identified.

New branch	Verified scope
Public/private administration	All 1,069 public hashes identified; 96 unique management transactions/receipts/headers checked across public/private and administrator contracts. Ten public setting mutations have before/after state.
Staking rules	Four May 2023 setters; eight adjacent states; exact historical implementation/runtime; principal/asset snapshots at the delay edits.
14cc / f27f	75 unique normal records; all 59/12 outgoing nonces checked, one revert in 14cc. Native ledgers reconcile.
9fa4 / trading cohort	Nine base transactions; 90 approval/trade samples; 34 native consolidation transactions. All 30 pinned nonce checks. 6,000 indexed rows sampled from 159,399 sender transactions.
LP / Tornado / bridge source	28 transactions; 26 outgoing nonces; seven GMI sales and seven Tornado deposits. Exact BSC bridge source verified.
Ethereum continuation	Exact source-hash receiving match, two native sends, mixed-wallet swap and Safe payment. Explorer/API evidence; independent Ethereum RPC unavailable.
Binance / Bitkub	Three Binance-path hops with sender balance checks. 2129 three inputs and collector routes, including September two-sweep zero-balance closure.

Records that would resolve the strongest concerns

Obtain dated approvals and signer records for the November allowance/removal sequence; ownership and delegated-admin custody records; investor notices/consent and per-user reward calculations for the schedule edits; market-making or distribution instructions for the 30-wallet cohort; and credited-account/order records for the exact Binance, Bitkub, MEXC and FixedFloat-associated endpoints. These are evidence requests, not records already obtained.

Open on-chain work includes the cohort's intervening lifetime trading, further unassigned GMI collectors, cbf3/f481 BUSD recipients, and a full historical internal-call/upgrade census. No Tornado withdrawal is linked to a particular deposit. The Ethereum Safe's wider activity and beneficial control are unresolved. A separate source review found an unguarded claimBack flag/amount pattern; all 158 decoded calls by repeat callers used different project IDs, so no repeated same-project direct payout was observed in that check.

The ZIP preserves the unchanged preceding evidence archive, new raw records, exact source/runtime checks, ledgers, capture manifests and this report's final hash. Full downloaded application pages omitted from the new layer have source/hash/outcome entries; original prior captures remain in the preserved baseline.

31. Tornado: what the transactions establish

These are actual privacy-pool deposits after GMI liquidation, repeated across two connected branches. The deposit registers contain 22 different transaction hashes and 22 different commitments: 11 deposits of 100 BNB and 11 of 10 BNB, totaling 1,210 BNB gross.

Branch / UTC dates, 2022	Verified entries	Direct context
d676 / 27-28 April	15 deposits; 1,050 BNB 10 x 100 + 5 x 10	Both GMI sellers, 82f and e696, fund d676. First deposit is 3m36s after 82f sells GMI.
3f963 / 27 July	7 deposits; 160 BNB 1 x 100 + 6 x 10	82f transfers LP tokens to 3f963; redemption and seven GMI sales precede its deposits.

Links: [27 April GMI sale](#); [first April pool deposit](#); [26 July LP redemption](#); [first July pool deposit](#). All 22 entries are individually linked in the unified deposit register.

A further rapid entry sequence occurs on 27 July: at 08:47:14, 3f963 converts USDT into exactly 120 BNB ([conversion](#)). After 75 seconds it deposits 100 BNB, followed by 10 + 10 BNB; the 120-BNB batch is complete by 08:49:14. This is funding inside the known depositor, not an identified Tornado withdrawal.

What Tornado conceals

The entry reveals its sender, pool, denomination and a commitment. A later exit reveals a recipient, relayer, fee and a different nullifier hash. The zero-knowledge proof establishes that a valid deposit exists without revealing which deposit it spends. The public commitment cannot simply be looked up against withdrawal hashes.

The spent-note check requires the nullifier hash, not the commitment. Possessing these 22 public commitments therefore does not tell us which notes have been withdrawn or remain unspent. The relevant possible deposits are constrained by the same chain, pool, denomination and withdrawal proof root; they are not all transfers everywhere.

Why this is a red flag here

The observable choice was to reduce public traceability after token sales and liquidity removal. The repeated use, rapid April timing and common upstream links make authorization and destination records material questions. The 10/100-BNB splits follow the pools' fixed denominations; the split alone does not establish a separate concealment scheme. No recovered project notice explains the reason for these particular deposits.

Reduced traceability is established; the operators' actual motive is not. The 1,210-BNB deposit sum includes mixed funding and is not an exclusive GMI-sale-proceeds or loss total. The separate July bridge remains transparently traceable and has not been identified as a Tornado exit.

Primary protocol sources: [core contract](#), [withdrawal circuit](#), and [pinned BSC deployment configuration](#). Raw captures and exact address comparisons are preserved.

32. Tornado exits: the checks and their limits

Four complete pool windows contain 444 Withdrawal events, with no exact recipient or relayer overlap against the 116-address comparison register. This pass establishes no particular exit for the 22 deposits. It does not show that the notes remained unspent or that a later withdrawal cannot be linked.

Window, 2022 UTC	10-BNB pool	100-BNB pool
27 Apr 23:57:00 through 29 Apr 02:11:32	194 events	59 events
27 Jul 06:19:00 through 28 Jul 08:49:14	162 events	29 events

Each window includes the entire deposit series and 24 hours after its final deposit. Adjacent block headers fix the cutoff; 16 successful archive log ranges cover all four pool/window combinations without gaps. Eight failed Binance endpoint attempts are preserved. The 444 logs represent 206 recipients and 33 nonzero relayer addresses.

What was compared

The 116-address union includes the report's BSC addresses, 30 cohort recipients, the two depositors and their verified normal counterparties, plus explicitly separated Ethereum address strings and Safe-owner references. No match was found in either recipient or relayer fields. Shared infrastructure would still need separate ownership evidence if a match existed.

The gas-side follow-up

Eight July withdrawals had zero fees; none had a zero relayer. Full transaction and Withdrawal-log checks show all eight used the same address, 1cf0...8661, as sender, recipient and relayer. That address is absent from the 116-address register. Its earliest 20 of 90 indexed normal transactions contain no positive incoming BNB, so this limited page check leaves its gas source unresolved. No deposit link is assigned to it.

How a real link could be established

Withdrawals and their onward payments remain public. Reused addresses, independently verified funding/return payments, or exchange settlement records could provide corroboration. Matching amounts, nearby times or a common relayer are candidate-selection clues; they do not prove which commitment was spent. Wider time windows and recipient histories remain outside this scan.

The strongest direct records request is a **verifiable transaction-history report for each identified deposit, showing the corresponding withdrawal hash and recipient**, supported by authorization and business-purpose records. Tornado's own [compliance-tool documentation](#) describes this note-holder capability. It does not require publishing raw unspent notes, which are spending credentials.

Primary fee semantics: the archived [native-coin implementation](#) pays the recipient the denomination less the relayer fee; a full note can therefore produce less than 10/100 BNB at the recipient. Those source semantics and exact BSC deployment addresses are preserved; this task did not independently recompile deployed pool code.

Continuation address register

Full addresses for sections 20-30. Ethereum entries are explicit; remaining entries use BNB Smart Chain. The 30-wallet cohort and 15-contract handover are fully listed in the evidence CSVs.

The current package preserves the preceding exchange census and source trails unchanged, with the new rule/control, LP, trading-cohort, bridge, Binance and Bitkub evidence added. Full transaction links appear beside each new finding; this appendix retains earlier identifiers.

33. Further exchange links and wider Tornado checks

The transparent Ethereum branch now reaches KuCoin-disclosed and OKX-labeled wallets. Separately, withdrawals from the examined Tornado pools reach Binance through identifiable recipients and collectors. No GamiFi deposit note has been paired with a withdrawal.

New result	What the evidence establishes
KuCoin	The previously identified Ethereum Safe sent 300,000 USDC through 1041c9 to a wallet in KuCoin's own disclosure. Two verified transfer events, 17m47s apart.
OKX-associated	The same Safe sent 100 and 1,255,106 USDC to 4d69ee; 1,255,206 USDC then reached an address labeled OKX 20 by Etherscan.
Binance candidates	Five April-window withdrawal recipients converged at a6cdd, which sent 999.559689 BNB to Binance 8894. Two further routes are documented on page 40.
Gas funding resolved	The zero-fee withdrawal account began with a 0.0979-BNB Tornado payout. Its 90 sender transactions and 85 withdrawal payouts reconcile exactly.

Expanded withdrawal windows

Branch / pools	Inclusive block coverage and endpoint
April / 10 and 100 BNB	17,324,279 through 18,182,757. First deposit to 28 May 2022 02:11:32 UTC, exactly 30 days after the final April deposit.
July / 10 and 100 BNB	19,909,171 through 20,774,741. Last included block: 26 August 2022 08:49:13 UTC; target cutoff 08:49:14.

The complete windows contain **7,298 withdrawals, 2,814 recipient addresses and 84 nonzero relayers**, including the prior 444 events. Neither recipients nor relayers match the 116-address comparison register or a separate set of 16 Binance-disclosed BSC addresses. Forty recipients appear in both expanded windows. All 54 failed main-scan attempts have successful replacements; all 167 new block ranges are closed.

The original 1,210 BNB remains a gross deposit total across 22 transactions, with mixed funding. The new downstream amounts are separate route observations; they are not added to project proceeds, losses or recoveries. Pages 1-37 retain the earlier investigation.

34. Ethereum: KuCoin and OKX connections

The route originates in the previously verified transparent bridge branch. Its pooled USDC payment reached Safe 525a on 28 July 2022. The Safe already held 6,493,868.210826 USDC before that 125,704.075705-USDC receipt.

Date / quantity	Verified movement
2 Aug 2022 300,000 USDC	17:19:40: Safe 525a → intermediary 1041c9. 17:37:27: 1041c9 → KuCoin-disclosed f16e9b. The intermediary's returned canonical USDC history and ending balance reconcile.
3 Jul 2024 1,255,206 USDC	10:54:11: Safe → 4d69ee, 100 USDC. 10:59:11: Safe → 4d69ee, 1,255,106 USDC. 11:16:11: 4d69ee → OKX-labeled 7eb6c8, 1,255,206 USDC.

KuCoin publishes f16e9b in its [11 November 2022 wallet disclosure](#). This supports organizational attribution; the disclosure postdates the August transfer. OKX attribution here is the [Etherscan OKX 20 label](#). The official reserve-download attempt and retry failed, so it is not presented as primary-confirmed.

The Safe's returned histories contain 121 canonical USDC, 178 USDT and 14 DAI rows. Filtering uses full token addresses, excluding counterfeit same-name tokens. The USDC ledger ends at 0.481761, matching the explorer balance. Eight selected full transaction records and separately fetched logs were checked. Historical balances are event-derived from Blockscout; independent Ethereum archive-RPC verification remains unavailable.

The Safe also received 14 USDC transfers from dd5217 totaling 2,582,144.820837 between January and July 2022. This was a pre-existing relationship. Neither the 300,000 nor the 1,255,206 USDC exchange payment can be assigned a specific GamiFi amount from the mixed Safe balance.

35. Tornado recipient routes to Binance

These are verified transfers after pool withdrawals. The link from a particular GamiFi deposit into any of these withdrawals remains unresolved. All three paths below end at 8894, an exact BSC address in Binance's published wallet table.

Route	Verified movement and accounting scope
Five recipients 28 Apr 2022	Ten 100-BNB withdrawals paid five addresses, net of relayer fees. They forwarded 99.987945 + 99.987945 + 99.947945 + 99.947945 + 599.688195 BNB to a6cdd. At 02:30:08, a6cdd sent 999.559689 BNB to Binance.
Two recipients 28 Apr 2022	5973aaa and 5c17b5 sent 9.982945 and 10.979495 BNB to 60450. The collector also received three other inputs, then sent 24.630575 BNB to Binance at 20:00:10. This is a mixed-fund route.
Later direct payment 19 Jun 2022	6f9f90 sent 199.805845 BNB directly to Binance. Its two sampled April pool withdrawals total only 20 BNB gross, and other funding exists. The whole June payment is not traced to those two withdrawals.

Five withdrawal recipients, in the forwarding-amount order above: [0x17586f23](#); [0x9fa84706](#); [0x471c6435](#); [0x38d3d39f](#); [0x7eb9e0a0](#).

The five recipient forwarding transactions each reduce that recipient's archived native balance to zero. Collector a6cdd retains 0.006395365 BNB after the Binance payment; this is not a full collector sweep. The two-recipient collector likewise retains 0.006395 BNB. Exact sender/recipient amounts, successful receipts and selected boundary balances are preserved.

The five recipients' withdrawals total 1,000 BNB gross, matching the denomination total of d676's ten 100-BNB deposits. The chronological and tree-state checks on page 42 restrict possible note matches but do not identify them. Amount similarity and a shared current pool root are not proof of a common owner.

Verified exchange collections

Five-recipient collector: [0x3b0f1168bfd44962b521b5a871d81b2519753044215c9c04394352e7ed67468b](#)

Attribution source: [Binance, Our Commitment To Transparency](#), 10 November 2022; exact BEP20 wallet 8894e0a0c962cb723c1976a4421c95949be2d4e3. The dated disclosure establishes a public organizational association, not the customer credited for an earlier deposit.

36. Gas seed, redeposits and onward activity

The previously unresolved zero-fee withdrawal address, 1cf0, was seeded from Tornado's 0.1-BNB pool. This closes the gas-funding question for that account; it exposes another withdrawal rather than a visible project-key payment.

18 July 2022, 18:14:50: a relayed 0.1-BNB withdrawal paid 0.0979 BNB to 1cf0 and 0.0021 BNB to its relayer. The successful receipt, native call trace and archive balances agree. The recipient had zero balance and nonce zero beforehand. Its first self-submitted withdrawal followed 4m03s later.

Account component	Verified BNB
85 net withdrawal payouts	463.8924
Seven redeposits	6.1
Final forwarding transfer	457.631418205
Gas for 90 sender transactions	0.160981795
Residual	0

All 93 distinct indexed transactions have full transactions and successful receipts. Sender nonces 0-89 are contiguous; the pinned chain count is 90 and balance is zero. The 85 payouts include 82 self-submissions and three relayed submissions. This incorporates the original eight zero-fee observations. It does not add eight new withdrawals.

On 3 August at 20:58:48, 1cf0 sent 457.631418205 BNB to 829254. Later, 829254 sent four verified USDT payments totaling 141,207.582674659643341201 to 20f0. Four successful source-side requests specified 141,207 USDT for Polygon/address 82f6ac. Polygon completion is unverified, and intervening conversions and mixed funding are not allocated to the 1cf0 payment.

The seed predates the July GamiFi sale and uses a different pool denomination. No withdrawal in this account has been paired with a GamiFi deposit. Its known-register overlaps are shared Tornado contracts only.

Gas seed: [0xec9bb8994686bb40ecb3b16917639d37cc859d1e081644acb4700766fd14b80d](#)

Final BNB forward: [0x2dfbeae6c9724b1950fd10dc76fda1a229c7d21875127ae662eacb20007ce1d4](#)

Last August Polygon request: [0xbb03af6388c994425f786418c285763b21153e967a081e10c10d891c98a48f4f](#)

37. Note exclusions and investigation coverage

The deeper checks narrow some possibilities. They do not reveal the hidden deposit-to-withdrawal mapping.

Test	Result and interpretation
Chronology / same pool	16 of the original 444 withdrawals occurred before their branch's first deposit into the relevant denomination: nine April 10-BNB withdrawals and seven July 100-BNB withdrawals. They cannot spend those later branch/pool notes.
Historical root / 20 candidates	Twelve April Binance-route candidates and eight July zero-fee withdrawals had successful receipts and matching calldata/events. Seven distinct root queries before the branch's first same-pool deposit were all false. This is inconclusive, not proof the notes are linked.
Partial root exclusions	April withdrawal cb18021c uses a root observed after d676's fifth 100-BNB deposit: its last five notes are excluded. Withdrawal 18b59cf0 uses the root after deposit eight: the last two notes are excluded. Earlier notes remain unidentified.

The ten d676 100-BNB deposits have consecutive leaf indices 7911-7920. All ten candidate withdrawal roots equal the latest pool root in the immediately preceding block, with no intervening pool deposits since the corresponding batch. These current-tree matches add no independent ownership signal. The first matching withdrawals followed batches five, eight and ten by 58m16s, 13m12s and 15m30s.

Why a false root test is inconclusive: [the protocol retains a circular history of roots](#). A root absent from that history may be older and overwritten. A positive, independently observed earlier tree state can exclude later leaves; it still contains many earlier commitments.

Recipient follow-up coverage

All 206 recipients from the original windows were queried: 300 index pages, 13,240 address-row records and 13,230 distinct transaction hashes. Of these histories, 185 are complete below the index cap; 202 are complete or reach the target from the first sampled withdrawal through seven days after the last. Four have target-window gaps from capped sampling. Thirty selected route transactions have full transactions, successful receipts and block headers. This is a native normal-output screen, not a complete token/internal census for all recipients.

No sampled native output exposes a new direct project/control-key match; shared protocols and exchange infrastructure are treated separately. These 206 recipient histories are not a claim that every recipient in the expanded 30-day pool windows has received the same onward review.

38. New address links and open records

Labels describe the observed role on the stated chain. They do not identify a beneficial owner or exchange customer.

Role / chain	Full address

Later bridge sender BSC	0x20f0ad2e0bd202a57bdf1aa53524145a2e8d5f4d

Focused follow-up

For the Binance candidates, the unresolved item is the note-level deposit/withdrawal link and the credited customer for the collector payments. For the Safe routes, it is the Safe operator, payment authorization and customer purpose. The note holder can supply a verifiable transaction-history report; raw unspent notes are spending credentials and should not be made public.

Two further source-side bridge leads are retained: a July [TokenHub request](#) for 895.83779264 BNB to bnb1vjs2l4m5rq9h09krqxtm35g9kpxe4us7m505y6, and a September Safe-funded [Synapse request](#) toward BSC/address 50c999. Destination completion is unresolved. These are leads, not additional exchange exits.

39 / More exchanges, clearer destinations

This continuation adds Bybit, Gate and further Binance routes, completes the previously open bridge paths, and tests the wallet-control connection behind a separate liquidity round trip.

Finding	What the evidence establishes
Bybit / Ethereum	A later mixed branch forwards 533,062.057758 USDC through an intermediary to a Bybit-disclosed wallet. All 21 USDC hops are checked in section 45.
Gate / BSC	The recovered Beacon route reaches a Gate-labeled endpoint in two payments totaling 895.8326016232 BNB. Its upstream wallets have mixed funding.
Binance / BSC	Seven newly examined recipient-level routes: one has five verified withdrawals followed by 499.345435 BNB into Binance; six more pass receipt and balance checks.
ONUS / BSC	The recovered sender history exposes five USDT transfers through one intermediary: 8,144 USDT into an ONUS-labeled endpoint.
Liquidity and control	302,000 USDC bridged through Synapse leads to DAO/BUSD liquidity. A subsequent Stargate leg returns 224,088.575976 USDC to the original Safe. Five configured owners overlap across two Safes.

These findings extend different branches. The transparent Ethereum Safe already pooled substantial other funds. The public Tornado recipients remain unpaired with GamiFi deposit notes. Exchange totals below therefore describe observed payments, not newly established GamiFi losses.

The strongest original concerns remain the rapid GMI-sale-to-mixer sequence and the documented funding, allowance and control changes. This continuation explains some downstream activity and supplies more exchange endpoints without treating every bridge, shared relayer or Safe transaction as incriminating.

Reading guide: sections 40–41 recover Beacon/Gate; 42–43 examine Binance and other recipient routes; 44–45 follow Polygon into Ethereum; 46–47 close liquidity and owner links; 48 records coverage and remaining limits; 49 documents the ONUS route. Earlier pages are preserved; newer findings close or qualify earlier open-lead descriptions.

40 / Beacon history recovered

The 895.83779264-BNB source request now has an exact protocol match in the official Beacon explorer. The route returns to BSC and later reaches Gate-labeled infrastructure.

BSC [165dec](#) was funded by two observed Tornado recipients, [d304225e](#) and [2cb30566](#). Their selected pool receipts do not account for all of the bridge amount. This upstream mixing prevents an exclusive mixer-fund allocation.

Step on 29 July 2022 (UTC)	Verified record
BSC request / 05:13:03	895.83779264 BNB to Beacon vjs2; 0x6c101843...14fe1d
Beacon claims / 05:13:49.599–51.281	Eight validator claims match one package: global sequence 3,717,577; channel 3; channel sequence 4,792,146. Amount, recipient, refund and expiry also match.
Beacon transfers / 05:15:36.401 and 05:15:58.044	vjs2 sends 1 + 894.83764264 BNB to frgp. Both payments plus 0.00015 BNB transaction fees equal the original requested amount.
Return request / 05:16:13.346	frgp requests 895.83356764 BNB to BSC 818e. Beacon transaction
BSC credit / 05:16:24	Successful TokenHub event pays exactly 895.83356764 BNB to 818e. 0x970cdd09...3d8e16

Beacon vjs2: [bnb1vjs2l4m5rq9h09krqxtm35g9kpxe4us7m505y6](#)
 Beacon frgp: [bnb18frgpxceqgc5d7zkyksexv6ggdrw9qfegmpnnk](#)

The return match uses all six RLP package fields, including the raw Beacon refund address and expiry. The successful BSC credit is independently checked. Beacon records come from its official explorer; historical Beacon balances and consensus proofs were not independently replayed. Eight claims mean one transfer. Raw Beacon address bytes are not treated as an EVM wallet identity.

41 / The Beacon branch reaches Gate

Two Gate-endpoint payments total 895.8326016232 BNB. The intervening BSC wallets and all four selected native-balance intervals reconcile exactly.

UTC	BNB	Verified onward transfer
07-29 05:18:24	10	818e36 → 850d18 0x1be586cb...e03c4a
07-29 05:18:48	885.83335764	818e36 → 850d18 0xe7d813b3...585710
07-31 10:09:49	895.83325264	850d18 → cf1f34 0x593c8848...a533b4
07-31 10:10:37	395.8	cf1f34 → 3321cc 0xf348e0b9...3cde49
07-31 12:32:10	395.7998319916	3321cc → Gate 1 0x7644e2fc...a5b103
08-06 14:19:15	200	cf1f34 → 3321cc 0x1e95af2d...98789c
08-06 14:50:09	300.03293764	cf1f34 → 3321cc 0xa4ddff43...8c5e21
08-06 16:18:35	500.0327696316	3321cc → Gate 1 0x345a7605...d40366

Gate endpoint: 0x0d0707963952f2fba59dd06f2b425ace40b492fe. BscScan labels this exact BSC address **Gate 1**. This is an explorer attribution; an exchange-published wallet row was not recovered.

818e, 850d and cf1 begin and end their selected intervals at zero. Collector 3321 begins and ends with 0.000000100002112299 BNB. Allowing that tiny old balance to mix, the route-funded component of the Gate payments lies between **895.832601523197887701 and 895.8326016232 BNB**. This does not allocate upstream GamiFi funds.

Evidence: beacon/findings.json; nine full BSC transactions, successful receipts and block inclusions; eight historical native-balance queries; official Beacon transaction and Oracle-claim captures. Two old cross-chain hash-lookup calls still returned 500, but protocol-field matching recovered the route.

42 / Five withdrawals, then Binance

A newly verified public withdrawal route reaches a Binance-disclosed wallet 25 minutes 33 seconds after its first withdrawal, and 18 minutes 39 seconds after its last.

3 August 2022 / UTC	Action and amount
16:34:34–16:41:28	Five 100-BNB-pool withdrawals to 01a731 . Gross 500 BNB; fees 0.65475; net 499.34525.
16:42:16	01a731 → 6ac367 : 499.345145 BNB 0x88b35344...e8fc85
16:42:43	6ac367 → a6b5a8 : 499.34504 BNB 0xefb3a4e3...5d63ca
17:00:07	a6b5a8 → Binance 8894 : 499.345435 BNB 0x1e415e17...c945e4

The recipient and first intermediary each start and end at zero. The last collector starts with **0.006395 BNB** and ends with **0.005895 BNB**. It contributes a net 0.0005 BNB of old balance toward its outgoing payment and gas; the final exchange amount is not solely the new withdrawal money.

All eight full transactions, receipts and block inclusions are verified. All five Withdrawal events match the decoded recipient, relayer and fee fields. Three historical balance equations close. Five different relayers handled these withdrawals; shared relay infrastructure does not identify the note owner.

Intermediaries:

[0x6ac367f0d34fb0b1828134c925b0863d07e2c11c](#)
[0xa6b5a85f2f3d91e1b3bc037d9c8daa0bab4263da](#)

Binance endpoint: [0x8894e0a0c962cb723c1976a4421c95949be2d4e3](#). [Binance's 10 November 2022 disclosure](#) names the exact BSC wallet. The disclosure postdates the transfers and identifies exchange infrastructure, not a customer. No withdrawal is paired with a GamiFi deposit note.

43 / More recipient-level exchange routes

Six further collector-to-Binance intervals pass full transaction, receipt and historical balance checks. Their endpoint amounts include differing amounts of other funding.

Recipient → collector	BNB paid to Binance	Exchange transaction
b27bf6 → 684541	920.56202879	0xeb02cdd5...c9a9eb
edb394 → 0460ed	51.575174938790401151	0x3a3af2a7...91f14b
cdb73a → cca999	99.962855	0x69eccb8f...9fcaea
35c2c6 → b5a97c	49.999658195	0x8f2ece99...8be43d
6b063f → 90e30d	43.462032	0xe55a6db5...833020
05356d → 4c77b7	60.179895	0xa1b1a523...1be437

For example, the 920.56202879-BNB output combines a repeat recipient's 299.744045 BNB, another address's 599.318195 BNB, and old collector balance. It cannot be assigned wholly to either the repeat recipient or GamiFi. Every listed collector retains a balance.

KuCoin-labeled route: on 4 August 2022, recipient 5803ae receives 9.98305 BNB net from a pool, then sends 10 BNB through 22c49c. At 06:51:20, [0x06276005...0ae087](#) pays **9.999895 BNB** to [KuCoin 28](#). BscScan's label is explorer-sourced. The original recipient already held 7.2455557 BNB, so the payment is mixed.

Across all 40 cross-month recipients: 8,347 unique indexed normal transactions; 36 complete normal indexes; four lifetime gaps, of which two overlap the 2022 windows. The lane verified 44 full transactions, 44 receipts, 43 distinct headers and 22 historical balances across eight selected exchange routes and other relationships.

Six later FixedFloat-associated payments totaling 6.626767 BNB and 41 indexed incoming Binance-infrastructure payments also appear. They indicate service use, not common customer identity. No native normal transfer in this screen directly matches a project funding/admin/control address.

44 / Polygon round trip closed

All eight bridge completions are exact source-hash joins. The August route passes through Polygon and returns to a new BSC recipient; it is no longer an unresolved source request.

Bridge direction	Requested USDT	Received USDT
BSC source → Polygon completion	100	99.5
BSC source → Polygon completion	10000	9999
BSC source → Polygon completion	30000	29997
BSC source → Polygon completion	101107	101096.8893
Polygon source → BSC completion	99.5	99
Polygon source → BSC completion	9999	9998.0001
Polygon source → BSC completion	50000	49995
Polygon source → BSC completion	81093	81084.8907

Totals: **141,207 USDT requested from BSC → 141,192.3893 received on Polygon → 141,191.5 requested back → 141,176.8908 received on BSC.** Polygon's opening canonical-USDT balance was zero. The four received amounts fund its return requests; 0.8893 USDT remains.

Polygon wallet: [0x82f6ac7d4c8a00a4cced3f673d67e1bcf8d7e8f8](#)

BSC return wallet: [0x1c44608f21043bac13bd6f2e078fc9889e719187](#)

This is the previously unassigned 1cf0 → mixed 8292 → 20f0 branch. The exact bridge matches do not allocate its upstream USDT to GamiFi or prove which Tornado notes funded 1cf0. Twelve selected cross-chain transactions, receipts and headers were checked; all ten failed RPC attempts were recovered.

45 / Ethereum continuation and Bybit

The Polygon/BSC continuation eventually reaches Bybit infrastructure: 533,062.057758 USDC through 1bb110 on 27-28 January 2024. All 21 transfer legs are verified.

Period	What happened
August–November 2022	BSC 1c446 swaps 50 USDT, then holds 141,126.8908 USDT for roughly three months. Historical balances confirm the holding interval.
22 November 2022	Two exact BSC→Ethereum joins deliver 995.1 + 140,111.9874 USDT to the same 1c446 address. BSC retains 0.8908 USDT.
23 November / 1 December	Another exact join from the same Polygon 82f6 wallet adds 70,148.58444 USDT. Combined 211,255.67184 USDT moves to Ethereum 60282.
March 2023 / later inflows	USDT→DAI conversion mixes with separately funded DAI. 300,000 DAI becomes 300,011.88247 USDC; later inflows add 233,050.175288 USDC.
27-28 January 2024	60282 pays 1bb110 in 11 USDC transfers; 1bb110 forwards the same 533,062.057758 USDC in ten transfers to Bybit f89d7. Its exhausted canonical USDC ledger ends at zero.

Intermediary: [0x1bb1102fb6145ff7b42854cb708c6ab1f67bb900](#)
Bybit endpoint: [0xf89d7b9c864f589bbf53a82105107622b35eaa40](#)

Bybit’s [June 2024 Hacken audit](#) lists the exact Ethereum endpoint on physical page 10. Snapshot 6 June; report 14 June. This postdates the transfers and supports organizational attribution, not a customer identity.

Ten endpoint transactions: [1](#) · [2](#) · [3](#) · [4](#) · [5](#) · [6](#) · [7](#) · [8](#) · [9](#) · [10](#). The evidence bundle contains all 21 legs, exact amounts, full transaction records, separate event pages and the canonical token ledger.

The extra Polygon tranche and later DAI/USDC inputs mean the final exchange total is mixed account throughput. Neither the whole amount nor a specific share is assigned to GamiFi. Ethereum balances are event-derived and API-verified; independent historical Ethereum RPC balances were not obtained.

46 / Synapse funds liquidity

The previously open 302,000-USDC Synapse request has an exact BSC completion. Its immediate use was DAO/BUSD liquidity provision.

23 September 2022 / UTC	Verified step
13:43:35	Pooled Ethereum Safe 525a sends 310,000 USDC to 50c999. 0x05db2dca...23a2dd
13:46:59	50c999 supplies 302,000 USDC to Synapse. 0x357dc71b...d7213a
14:04:10	BSC 50c999 receives 301,792.181393206737262224 BUSD. 0x50bbc090...8ac037
Later liquidity activity	A separate BSC Safe supplies 200,000 DAO. Approximately 300,000 BUSD and 190,444 DAO enter a liquidity position, subsequently removed/migrated in January 2023.

The join is not based on timing: Keccak-256 of the UTF-8 lowercase source transaction hash, including its 0x prefix, equals destination kappa **6ea98b6a...1c7d77b**. Calldata and event agree on kappa, intermediate nUSD amount, recipient, chain, token indices, minimum output and deadline.

50c999's 15 sender nonces are all receipt-verified. The selected wider lane contains 30 full BSC transactions and token ledgers. A later LP recipient adds separate capital, which prevents an exclusive allocation of the later return to the original 302,000 USDC.

The original Safe held 6,493,868.210826 USDC before the investigated July receipt. This is a transparent downstream branch from pooled funds; it is not a Tornado withdrawal match. The observed liquidity use gives a concrete explanation for this leg.

Evidence: synapse/findings.json and token_ledgers.json; [Synapse explorer's kappa derivation](#). Ethereum evidence uses full Blockscout transactions and separate logs; BSC evidence uses RPC receipts and selected archive state.

47 / Shared owners and money returned

All five configured owners of Ethereum Safe 525a were also among the six owners of **BSC Safe 43184** on 23 September 2022. This is a direct wallet-control configuration link.

Common configured owner on 23 September 2022	Safe membership
0xbc832c02920d53c37e9590dfb129975eab468dee	Ethereum 525a + BSC 43184
0xbcd705ed328ca48e6112925b980cf80673743407	Ethereum 525a + BSC 43184
0xd2361dc1334414c82add43a478c026770bc091d6	Ethereum 525a + BSC 43184
0xe504a4c4c7edced18f445eb0ff94ed5a8f708855	Ethereum 525a + BSC 43184
0xe5342d500d7e5578d412f0379abed1fe08ba85b5	Ethereum 525a + BSC 43184

Ethereum Safe 525a was **3-of-5**; the BSC DAO-supplying Safe was **4-of-6**. The shared set numerically exceeds both thresholds. This identifies configured owner addresses, not human custodians or the actual signers of each payment.

The Ethereum reconstruction uses Safe creation data plus 106 bounded logs through block 15,596,438. Three August management transactions are separately checked. BSC `getOwners/getThreshold` comes from historical archive calls. The prior report's July 4-of-6 snapshot is correct for that earlier date.

Return to the original Safe: on 24 January 2023, 412869 sends 224,223.10984 BUSD through Stargate on BSC at 11:52:24. Ethereum pays 224,088.575976 USDC at 11:54:11; the same amount reaches Safe 525a at 12:03:59.

[BSC source](#) | [Ethereum credit](#) | [Return to Safe](#)

LayerZero nonce 5,826, source/destination bridges, packet payload hash and source block hash all match. The nominal 134.533864-unit difference matches encoded swap fees. This closes a liquidity-management round trip with added capital; it is not an exchange cashout or a GamiFi profit/loss calculation.

48 / Recovered scans and remaining limits

All four previously flagged normal-history target gaps are closed. The recovery adds 241 normal transactions: 240 outgoing and one incoming. Every newly recovered transaction has a full receipt.

Recipient	Target period / 2022 UTC	Sender count	New rows
57dd3f...d4840c	07-27 09:19:29 to 08-03 09:19:29	0	0
58ef0d...dde760	07-27 20:09:30 to 08-03 20:09:30	5	0
69b405...be1d14	04-28 23:16:03 to 05-05 23:16:03	316	186
e64e84...1e6b4a	04-28 05:34:02 to 05-05 05:34:02	55	55

229 succeeded; 12 reverted. Reverted calls are not counted as successful value transfers. The two zero-new-row flags were overly conservative: their retained descending pages already covered the target. Sender nonce checks independently confirmed zero and five outgoing transactions.

The recovery uses a verified direction filter plus historical nonce counts to find missing sender transactions in full blocks. Across the four target windows, 379 full transactions are checked: all 376 sender transactions and three incoming records. There are 246 fresh target receipts: the 241 additions plus five previously indexed transactions. Five additional ONUS output receipts are checked separately.

These are bounded normal-transaction histories, from first sampled withdrawal through seven days after the last. Sender completeness is established by contiguous nonces. Incoming coverage follows the public index; token/internal transfers initiated by other accounts are separate.

Remaining work is explicit: the separate 40-recipient expansion retains two 2022 target-index gaps (4f5b71 and c3a367) plus two later lifetime gaps. The additional November Polygon funding, other Ethereum mixing inputs, and a 58ef0d → 40cc5f BUSD branch remain unallocated or incompletely followed. The 2,814-recipient pool-wide census is not a completed onward investigation of every recipient.

OKX's two official reserve ZIP downloads were retried this round; both timed out. Its prior endpoint remains Etherscan-labeled OKX 20. Bybit and Binance have exact organizational disclosures; Gate, ONUS and the new KuCoin 28 endpoint remain explorer-grade. Exchange attribution and transaction verification are recorded separately.

Reproducible evidence includes the 241-row recovery CSV, raw requests, full blocks/receipts, nonce boundaries, failed attempts, exact bridge joins and independent reviews. Earlier descriptions of the four original gaps and source-only bridges are superseded by this continuation.

49 / Archive recovery reveals ONUS route

Recovering previously missing e64 sender transactions exposed five USDT payments through 5f330 to an ONUS-labeled address. Both sets total 8,144 USDT.

2022 / UTC input to intermediary	USDT	Onward to ONUS-labeled endpoint
04-28 05:41:35 0x642df8e3...53957d	1098	0xf1b72af8...864a01
04-30 00:48:08 0x1a1d8af5...33e84e	2000	0x9aae1223...1cc1a2
05-01 02:53:44 0xf019349d...385dd3	1000	0x68050eff...a74c30
05-02 23:17:33 0xce432ff8...690e09	1959	0xd401014a...53e12a
05-05 00:38:57 0xebdf1dc9...1ef6c4	2087	0xfdf54a72...8fd8da

Initial sender: 0xe64e84f76527985a03120591a5392e48461e6b4a

Intermediary: 0x5f330ba134051d247a6700babed73b587b75b21b

Endpoint: 0x893064ca1550c9ced53e85e24a72679f59385b07

All ten transfer legs match successful receipts and canonical BSC USDT logs. The intermediary retains the same **0.000276077681813602 USDT** opening and closing balance. The e64-funded component of its combined endpoint payments lies between **8,143.999723922318186398 and 8,144 USDT**.

BscScan labels the endpoint **ONUS 1**. The label was recovered independently on transaction pages; no exact first-party ONUS wallet disclosure was found. The initial sender has other funding and DeFi activity. This is a recipient-level route, without exclusive Tornado provenance or a GamiFi deposit-note match.

A separate later exploit write-up also mentioned 5f330. A shared intermediary or exchange route cannot establish that the same attacker or customer controlled these payments. That article is not used as evidence of GamiFi involvement.

Evidence: gaps/verified_onus_route.json and recovered full-block sender transactions; independent label and arithmetic review. The finding illustrates why the index gaps mattered: omitted contract calls carried token transfers that a native-value-only screen would miss.
