

GamiFi project history: 5 September 2026

Historical source edition | 5 September 2026

Public crypto research edition. The following material preserves historical analysis, source identifiers, transaction amounts and stated qualifications. Observations retain their original dates, principally 5-7 September 2026. Preparing this edition did not repeat the blockchain, corporate-registry or legal research.

Read each assertion with its cited source and limits. A public role, a wallet connection or a valid transaction does not by itself identify a human operator, prove personal receipt or establish wrongdoing. The reports distinguish findings, interpretations and unanswered questions.

Correction precedence: the 7 September 2026 ShibaFriend claims review reports repayment of the principal of all 23 non-dust funding addresses, with only 168 base units of dust unmatched. It also reports equal project matches for all 194 identified paid Mystery Box mints. Those later findings supersede earlier uncertainty about those specific questions. See [Research_Paper_ShibaFriend_Claims_Review.pdf](#).

Original source-page labels and reference identifiers are retained where useful. Gaps in numbering reflect the crypto-only scope. Historical references to companion records are locators; consult the repository inventory to see which records are included. Current availability of an external source is not guaranteed.

GamiFi.gg / GMI

Project history, law and blockchain evidence

Expanded archive investigation and verified contract analysis

5 September 2026 | Public records, historical archives and selected chain checks

The strongest documented legal inquiry is misleading promotion. A paid NFT offer advertised access to three IDOs after the launchpad announced a pause. The archive also preserves contradictory NFT quantities, a tenfold token-price correction and a valuation error. These are specific representations to assess for materiality and responsibility; they are not proof of fabricated trading volume.

Parts of the product existed. The chain now verifies 200 Mystery Box NFTs, 193 Duke character NFTs and two membership contracts with supplies of 12 and 100. NFT supply is not a paid-sales count. The Mystery Box and Duke implementations were independently recompiled and matched every byte of live code.

The advertised burn has a real mechanism, with an important distinction. Public purchases send 25,000 GMI from the buyer and an equal prefunded contribution to the designated sink at current settings. Owner batch issuance sends only the prefunded contribution. That sink holds 9,850,042 GMI; this balance does not identify every contributing transaction. A read-only purchase simulation currently fails because the contract has no matching reserve.

The checked markets have very little quote liquidity. Three factory-verified PancakeSwap pools hold approximately 0.8442 WBNB, 0.00468 BUSD and 0.02076 USDT respectively. Thin present liquidity establishes neither who removed earlier funds nor a wash-trading scheme. A complete 24-block check around the announced listing minute found no GMI/pool logs; this is a bounded historical result, not a full trading audit.

Laura's CEO and promotional role is documented. Her own dated statements matter independently of wallet custody. GamiFi announced a successor on 1 September 2022; the October pause and later stale offers must not automatically be assigned to her. The current shared contract-control address has no established human identity.

The legal analysis separates offences, evidence and dates. Canadian misleading-advertising, fraud and securities provisions have different requirements. Archived terms claim a BVI issuer and exclude Canada; actual territorial connections remain material. BVI investment law requires product/activity classification, and the VASP regime began in February 2023. No reviewed record establishes a GamiFi conviction or proves Laura controlled manipulative trading.

The following pages retain the full project chronology and document changes, then explain the new on-chain results and applicable legal tests. Original records, source code, compiler outputs, RPC responses and primary legal sources are preserved in the accompanying ZIP.

1. Launch and the first delivery cycle

The business proposition: a platform for blockchain-game token offerings. GMI holdings, staking and qualifying NFTs were promoted as routes to allocations. Allocation access still required payment for the partner tokens. This was a recurring-offering business whose utility depended on projects continuing to launch.

Date or first observed capture	Promise or observed event
7 September 2021	Prelaunch homepage describes the concept and uses figures such as ten monthly IDOs. This is early promotional/placeholder content, not evidence ten offerings occurred.
November–December 2021	Litepapers and the substantive website describe launchpad access, NFT memberships, fees, financing and future development. The original roadmap remained visible through 5 July 2022.
17 January 2022	On-chain creation of one billion GMI. The January 27 homepage still says the app is coming soon.
31 January 2022	Official announcement doubles the four GMI participation thresholds while retaining the same ticket counts. This was a disclosed change.
3–18 February 2022	Archived app/staking code and NFT purchase pages exist. The homepage links to the app by February 14; February 18 podcast notes report the first NFTs launched.
March 2022	GAMI and Time Raiders offerings were promoted. Later company communications report completion and distribution activity.
4 May 2022	GamiFi acknowledges only two completed IDOs and extends Golden Ticket validity. The original expiry was three IDOs or three months, whichever came first.
23 May 2022	FOMO's planned token-generation event is delayed to Q3, with refunds promised for funded allocations. A new schedule follows in September.

Sources: [earliest homepage](#); source [January snapshot](#); [tier announcement](#); [May extension](#). The communications ledger in the ZIP provides the article IDs, archived payload paths and dates for the complete sequence.

One unresolved commercial discrepancy: the February 28 GAMI issuer release advertised a \$100,000 target, while the March 28 archived GamiFi project page displays \$50,000. These are offering targets in different publications, not competing verified cash balances. The recovered intervening schedule updates do not explain the reduced figure. [Issuer release](#); [archived project page](#).

What can be concluded: the company ran a visible launch process and reported two early IDOs, but opportunities were sparse enough to require an NFT-validity accommodation. Sale targets, whitelist lists and completion announcements do not reconcile actual receipts or investor outcomes.

2. Products: promise versus observed delivery

Product	Promised benefit	Observed evidence and result
GMI token	Launchpad participation and staking utility	Initial one-billion supply and current implementation verified. A surviving token does not prove continued launchpad operations.
Golden Ticket / access NFT	100 BUSD; access for three IDOs or three months; allocation still paid separately	Archived buy interface and two linked NFT contracts exist. Current supplies are 12 and 100; paid-sale counts and holder benefits were not reconciled.
Staking	Token rewards and time-limited pools, including advertised annualized rates up to 225%	Multiple archived pool pages, addresses and deposit/withdraw interfaces recovered. Interface and ABI presence do not prove reward funding or completed payouts.
Ultimate Fighters	June 4 announcement of a second NFT series with ten characters	Promotional article recovered. No mint-completion receipt found in the communications corpus; July's different Mystery Box collection is not established as its replacement.
Mystery Boxes	25,000 GMI from minter plus equal company contribution to a burn; NFT-gated staking	Current deployed code exactly matched; 200 boxes and 193 Duke NFTs verified. Current cap is 500. Public purchase simulation fails for lack of matching GMI reserve; see section 6A.
Four mini-games	Token-gated access to Indiara, Neon Pong, Pac-Rat and Hexagon Fall	Four archived routes and iframe-loading code recovered; August article reports release. Embedded game files are absent from the successful project-period archive index. Gameplay and rewards were not executed.
Realm / broader interoperability	Community Realm and broader cross-game functionality	Announcements exist. The recovered corpus does not establish completion of each proposed integration.
Media	Industry interviews, community education and project promotion	RSS contains 39 episodes; official Medium corpus contains project and editorial articles. Publication itself is demonstrated.

NFT validation is narrowly reproducible. At BNB Chain block 120,175,162, read-only totalSupply calls returned 12 for **0x01247d730f7445b81a3fad9be567994c0196dd9c** and 100 for **0x0be0e13c828b60b53d7577651cc54581855f7bad**. Both return the name GamiFi RPG. A token-owner query also succeeded for each. Raw requests/results and the app code linking these addresses are preserved.

Game mechanics matter. The recovered code checks a wallet's GMI balance before loading a game; it does not establish a per-play token payment. The interface describes virtual GMI rewards. Treating those as verified transferable-token or cash winnings would overstate the evidence.

Sources: [Ultimate Fighters](#); [Mystery Boxes](#). Product pages, ABIs, address roles and game-code excerpts are indexed under app_lane in the ZIP. No wallet was connected and no purchase or staking transaction was sent.

3. Changes and inconsistencies in the record

The litepapers changed before and after launch. Four complete archived editions were recovered, plus two partial archive payloads and a complete third-party mirror. The original files, extracted text, differences and validation results are included.

Document issue	Rechecked result
November 15 private-round valuation	The table's \$20 million at \$0.018 per token implies a different valuation from one billion total tokens. The November 18 edition corrects it to \$18 million.
TGE market cap	18 million circulating tokens × \$0.03 = \$540,000; the paper states \$577,500, a \$37,500 difference (6.94%). It persists in the four complete archived editions examined.
NFT terms before token launch	November 15 discusses resale after three uses. November 18 removes that passage and specifies three uses or three months. This revision predates the January token launch.
Participation thresholds	January paper: 5,000/3,000/1,000/500 GMI. February paper: 10,000/6,000/2,000/1,000, with 15/10/5/3 tickets unchanged. January 31's announcement explicitly explains the increase.

The financing plan totals \$3.055 million; it is not a verified receipts ledger. The published 5% allocation fee likewise establishes a proposed commercial term, not collected revenue. [November 15 paper](#); [February paper](#).

Staking disclosure changed within hours. The February 3, 13:16:04 UTC capture lacks the warning that locked GMI cannot also be used for IDO participation. The 14:42:31 capture includes it; embedded modification metadata says 13:44:32. Users were told to hold additional GMI. This is a demonstrated disclosure addition, not proof the contract changed that day. Separately, February 3 app HTML describes a 60-day middle pool but warns of a 45-day lock in the same page.

Launch-control wording became broader. The January 17 Fair Launch Notice initially described a 1% fee and temporary freezing during the opening hours. That wording remains in the January 18, 12:18:26 capture. A revised body, first recovered June 27, removes the fee paragraph and extends the restriction horizon. Its metadata reports a March 14 edit. Publication metadata and first observed archive evidence are different dates; neither proves a fee was actually charged.

The Mystery Box mismatch was persistent. Every one of twelve recovered captures, July 3, 2022 through December 11, 2023, contains both quantity figures. There is no recovered clean 1,000-to-500 revision to explain it. The current contract cap is 500. Its separate owner-issuance path also means that supply alone cannot establish a burn shortfall; see section 6A.

Exact before/after article bodies, timestamps and hashes are in communications_lane/article_text and its difference ledger. These errors and changes should not be relabelled fabricated trading volume.

3A. Further changes in offering terms

Time Raiders: a tenfold price correction. The March 3, 2022 capture of the IDO announcement specifies \$150,000 at \$0.22 per token, approximately 681,818 tokens. The corrected version specifies \$0.022 and approximately 6.818 million tokens for the same target. Its metadata dates the edit to March 5; the first recovered corrected capture is August 10. This establishes conflicting published unit-price terms and the document's revision metadata. It does not establish which price buyers actually paid. [Original capture](#); [first recovered corrected capture](#).

May staking: larger published maximum amounts. Both May 4 pool announcements initially list 1.5 million GMI as the maximum staking amount for each public pool. Later versions list 6 million for the 60-day pool and 3.4 million for the 90-day pool, while retaining the 150% and 175% APY labels. Both articles' metadata dates the edits to May 7; the first recovered changed bodies are June 27. A published limit is not a measured deposit or reward reserve. [Original pool-open notice](#); [revised notice](#).

FOMO: the same announcement carried two schedules. The initial May 5 article schedules whitelisting May 6–9, funding May 9–13 and listing May 16. The later version changes these to May 9–13, May 16–23 and May 30. The separate May 23 notice then delays the token-generation event to Q3 and promises refunds. September's later launch/distribution report does not settle whether those May refunds occurred. [Initial May article](#).

Why these distinctions matter: there are several kinds of problems in the record: arithmetic mistakes, revised commercial limits, rescheduled offerings, contradictory terms within a single document, and an offer left online after a service pause. Each has different implications. A numerical correction is not automatically a false sale receipt; a changed schedule is not automatically a failed refund; an unremoved buy page is not proof of a later completed sale.

The accompanying text-difference ledger records the complete recovered article versions. All 202 later captures, dated February 2024 through November 2025, match earlier versions of their 25 articles in body text and paragraph/link structure. No substantive later revision was found in that corpus. Publication dates are not inferred from crawl dates.

4. Laura's involvement and the claimed issuer

CEO and launchpad establishment. The archived team page identifies Laura Walsh as CEO. Nativz's July 2022 account states that she established GamiFi within Alphabit. These sources document a leadership and business-development relationship beyond a casual mention. They do not identify who held corporate shares or controlled every wallet. [January team page](#); [Nativz account](#).

Direct token and partner promotion. MEXC's February 23 interview attributes to Laura statements about GMI acquisition on MEXC/PancakeSwap, staking-based allocations, fundraising completion, legal diligence and a PeckShield audit. A GAMI issuer release quotes her endorsing the first partner offering. These are attributable promotional acts and representations; the fundraising and audit claims need their own supporting records. [MEXC interview](#); [GAMI release](#).

Burn initiative promotion. The July 1 podcast episode 33 description names Laura as CEO and Casey as VP Operations and describes their discussion of the coming gamified burn initiative. The feed and episode audio are saved in this evidence package; the audio was not transcribed for this report. The description establishes promotion; it does not establish token destruction or either speaker's wallet ownership. [Podcast feed](#).

Leadership succession. The September 1 company announcement names Eleanor Rooney as successor. The homepage still names Laura on September 4 and switches to Eleanor by September 6. The later pause was signed by Eleanor; later recovery messages attributed to Casey or Eleanor should not automatically be assigned to Laura. [September 4 capture](#); [September 6 capture](#).

The recovered legal terms identify an entity. The app's terms name GamiFi Limited and represent it as incorporated in the British Virgin Islands. They state a January 25, 2022 revision date, but the earliest retrieved terms capture is October 7. They require age 18 or older and explicitly prohibit Canada and the United States among other jurisdictions. Their BVI governing-law/arbitration language also includes a later reference to "UK" arbitration law, an inconsistency requiring legal interpretation rather than an automatic invalidity finding. [Archived terms](#).

Namesake and children claims: an education-business search result does not link Ottawa's Gamifi Inc. to this issuer. A GamiFi podcast did feature Art Chops/Lantana summer camps; that interview is not evidence that GamiFi sold tokens to minors. No connection to Isinsu Sakalli is established by the records in this package.

5. Pause, continuing offers and domain loss

Cancellation preceded the pause. On June 29, GamiFi canceled the next day's ShibaFriend public IDO, citing changing tokenomics and insufficient time for contract and investor updates. It proposed refunds or an alternative private allocation plus 1,000 GMI. Those are promised remedies; the recovered communications do not reconcile settlements. [Cancellation](#).

FOMO returned to the schedule. After the May postponement, a September 20 notice scheduled funding for September 25–27 and listing for September 28. Official Telegram post 813 subsequently reported token distribution. This is company-reported delivery, separate from proof of May refunds or the value received by buyers. [Schedule](#); [distribution report](#).

October 3, 2022 is the decisive service announcement. Eleanor paused IDOs, described reduced social activity and put GMI price/performance and rebuilding at the centre of the plan. It was not a permanent dissolution notice. My inference is that the limited launch pipeline and token-dependent participation model were under strain; the record does not isolate operating losses, market conditions and management decisions. [Company statement](#).

A purchase offer remained after the pause. The archived buy-NFT page still advertised 100 BUSD and three-IDOs/three-months access on October 4, 2023. That leaves the public-facing offer inconsistent with the announced suspension. It does not prove anyone bought after the pause. Attempts to establish historical NFT mint timing did not recover a usable event ledger; mutable candidate membership timestamps were not substituted for mint dates. [Archived offer](#).

Further retention and recovery promises. Later Telegram posts 820–822 describe five-to-six-month and six-to-nine-month rebuilding horizons, possible MEXC delisting and a six-month pool at 40% APR. Exact calendar timestamps were not recovered; message order has not been converted into invented dates. Launchpool's 2024 update reports GamiFi vesting completed, which is a delivery report, not proof of profits or a launchpad restart. [Official channel](#); [Launchpool update](#).

The website became stale, then changed purpose. The last recovered substantive project homepage is July 25, 2024, still carrying the 2022 roadmap. The earliest recovered adult portal is May 14, 2025 at 11:42:26 UTC. The change is bounded between those observations; operator identity and cause remain unestablished. All homepage requests, returned capture dates and errors are preserved. [Last project capture](#).

6. What the blockchain actually establishes

BNB Smart Chain token: **0x93d8d25e3c9a847a5da79f79ecac89461feca846**. Primary evidence consists of public RPC transaction receipts, storage and runtime code. All times below are UTC.

Event	Verified record	Meaning
17 Jan 2022, 23:09:27	Block 14,456,972; creation receipt emits a transfer from the zero address of 10^{27} raw units	Initial creation of exactly 1,000,000,000 GMI at 18 decimals
18 Jan 2022, 23:16:28	Block 14,485,483; successful upgrade to implementation ending 3514e	Token logic changed
18 Jan 2022, 23:16:58	Block 14,485,493; successful upgrade back to implementation ending 3d405	Original/current logic restored 30 seconds later

[Creation transaction](#) · [first upgrade](#) · [return upgrade](#). Explorer links identify the records; the findings were verified through RPC receipts, not dependent on explorer-page availability.

Minting. Recompiling the recovered Token.sol with Solidity 0.8.7, optimization disabled and OpenZeppelin 4.4.1 reproduced all **6,989 executable bytes** of the deployed implementation. Its full runtime is 7,042 bytes; compiler metadata differs and was excluded explicitly. The coordinator independently repeated the byte comparison. The initialization path creates the initial supply once. No public mint or burn function appears in this matched implementation, and initialized state was verified. A different repository file with an unrestricted mint function did not match deployment and was excluded. [Matched source: Token.sol](#).

Administrative control. The token is a transparent upgradeable proxy. At the sampled state, its implementation is **0x4397c4bfa7e351c392ca31d0d28becc6dfb3d405** and administrator **0xf27f9a2eb9b2c70d32476cf9dc2d74ca4e61c27b**. The administrator address had no deployed code. This identifies an on-chain control address, not its human holder or key-management arrangements. The original administrator was a different address. [ERC-1967](#); [OpenZeppelin proxy documentation](#).

Transfer restrictions. The matched token invokes an external anti-bot contract before transfers. The temporary implementation and intervening successful call changed that hook's address. Neither upgrade receipt contains a mint/transfer event. The anti-bot component has its own proxy and controls; its full source was not matched. Therefore its detailed blacklist policy, every historical rejection and who authorized each restriction remain outside the verified result. The company had publicly announced blacklist/freeze protections on January 17. [Fair Launch Notice](#).

Current check. At block **120,169,386**, the coordinator independently re-read the same implementation and administrator, 18 decimals and exactly one billion total supply. This snapshot is not an all-history mint/burn audit. Upgrade authority means the present implementation's supply behavior is not an immutable guarantee. Sending tokens to a burn address can leave the token contract's reported totalSupply unchanged; the new matched-burn analysis follows in section 6A.

6B. Market liquidity and the historical trading test

Three pools were verified directly against the PancakeSwap factory. Factory mappings, token order and decimals were read independently. The table uses three closely timed fixed blocks on 5 September 2026, not one identical state block. It covers the three queried quote assets; other pools and centralized-exchange trading are outside this enumeration.

Market and state block	GMI reserve	Quote reserve
GMI/WBNB — 120,181,991	264,515,119.8415113	0.8441956815 WBNB
GMI/BUSD — 120,182,018	2,441.9067969	0.0046795036 BUSD
USDT/GMI — 120,182,043	11,155.5910669	0.0207647611 USDT

The addresses: GMI/WBNB is 0x58d4b61983ca0afe6e352e90719f403e24e016f4; GMI/BUSD is 0xccab7bb7f864fabdfa1e5dc8465543735c9e4534; USDT/GMI is 0x6d76baed9761e4ffe72f51751bf4078f87a25e01. Raw integer reserves and full precision are retained in pool_state.csv. The tiny quote balances demonstrate thin present liquidity, not past volume, cash proceeds or the beneficiary of any removal.

Liquidity-token custody is not beneficial ownership. At block 120,182,209, the main pool had 7,081.19578035 LP tokens outstanding. PancakeSwap MasterChef V1 and V2 held 492.49720543 and 4,320.25450545 LP respectively, jointly 67.96524%. Public farming custody can represent many depositors; it is not proof of a single owner or a time lock. Two examined project-control addresses had no directly held LP in the snapshots, which does not exclude deposited positions or earlier holdings. [Official factory documentation](#); [MasterChef identities](#).

A complete, explicitly bounded historical test. The Fair Launch Notice advertised 18 January 2022 at 14:30 GMT. All receipts were recovered for 24 consecutive blocks, 14,475,046–14,475,069, covering 14:29:52–14:31:01 UTC. The 14,751 receipts exactly matched the block transaction lists, with verified block hashes and unique indexes. They cover all chain activity in that interval, not 14,751 GMI trades. [Dated announcement](#).

Result: zero logs from GMI or the three verified pools, and zero direct receipt destinations to those contracts. There are no pool swaps to classify in that minute. Failed router attempts require transaction inputs to identify their intended token. This result does not establish that listing never occurred, that a delay was unlawful, or that later trading was clean or manipulated.

The wash-trading allegation remains unproved by this dataset. No repeated linked buy/sell sequence or personally attributable insider sale was recovered. The available official RPC disables broad log retrieval; selected historical receipt access worked. Refused and failed provider requests are preserved. No artificial-volume percentage or statistical backtest was manufactured from incomplete or empty trade data. [BNB RPC documentation](#).

Evidence: legal_chain_followup/trading_lane contains discovery, fixed-block state, custody calculations, historical receipts and coverage validation. These measurements support the conclusions above, not an all-history treasury or trading audit.

7. Misleading promotion and criminal fraud

My assessment: materially misleading promotion is the strongest documentary legal inquiry. The most direct comparison is the October 2023 offer of 100 BUSD for three-IDOs/three-months access against the October 2022 IDO pause. The 1,000/500 quantity conflict, tenfold price correction and valuation discrepancy are additional representations. Materiality, surrounding disclosures, publication responsibility and territorial connection must be assessed separately for each.

Civil misleading advertising — Competition Act 74.01(1)(a). A materially false or misleading public representation promoting a product or business interest can be reviewable conduct. This limb does not require knowledge or recklessness. General impression and literal meaning both matter. Section 74.03(4) does not require proof an individual was deceived or that a member of the audience was in Canada. Consequently, a completed NFT purchase is not a prerequisite to this route. [2022 provision; interpretation](#).

Criminal misleading advertising — Competition Act 52. Knowledge or recklessness is additional to materially misleading public promotion; permitting a representation is included. Again, actual deception is not indispensable. Repeated publication after a person learned an offer was false would be relevant evidence; a stale page alone does not establish that knowledge. The public pause and disclosed corrections must be included in the context. Laura's September 2022 succession prevents automatically assigning her later publication failures. [2022 criminal provision](#).

Fraud — Criminal Code 380(1). Dishonest conduct causing economic deprivation or risk of deprivation can qualify without the token being a security. A knowingly false availability, burn or refund assurance that exposes purchasers' funds could fit; ordinary failure cannot substitute for dishonest conduct and the required subjective knowledge. *R. v. Thérout* explains that hoping a venture succeeds does not excuse known deception. *R. v. Riesberry* confirms that caused economic risk may suffice without a completed loss. Neither removes the need to establish the prohibited conduct, mental element and causal connection. [Section 380; Thérout; Riesberry](#).

Knowingly false company fundraising statements — Criminal Code 400. This is not confined to formal prospectuses or shares. Section 400(1)(c)(i) can reach a knowingly materially false statement intended to induce someone to entrust or advance property to a company. A fundraising litepaper could qualify on the facts. Its title, an arithmetic error or an unmet projection does not itself establish the required knowledge and intention. [Section 400](#).

Application to the burn evidence: the current public-buy function enforces the match and now rejects an unfunded purchase. That weakens a claim that this implementation simply takes a buyer's payment without its required match. Owner issuance is different and must be classified separately. The sink balance does not reconcile every advertised burn, refund or staking payment.

These are distinct potential enforcement routes, not a finding that a named person committed an offence. In particular, civil reviewable conduct must not be presented as a criminal conviction.

7A. Securities, market manipulation and responsibility

Investment classification must come first for securities-specific rules. Capital raising for future development, organized token allocations and team-dependent return promotions warrant investment-contract analysis. A utility label does not settle it. Assess the GMI sale, each partner offering, NFT package and staking arrangement on its own terms. Pre-2022 CSA guidance addresses these issues. [CSA 46-307](#); [CSA 46-308](#).

Quebec route	Application to GamiFi
Sections 1(7), 11-12: investment contract and distribution	Establish classification and a valid prospectus/exemption route. Section 12 specifically addresses distributions from Quebec to outside buyers; a Canada-excluded clause is not a universal answer.
Section 148: dealer registration	Recurring partner offerings, solicitation and an allocation fee support examining a dealing business. Prospectus and dealer exemptions are separate.
Sections 197(1), 195.2, 199.1	Material transaction misrepresentations and manipulative trading have distinct tests. A litepaper is not automatically a statutory prospectus; an erroneous number is not automatically material fraud.
Sections 7, 205, 208: individual acts	Relevant disclosure, authorization and assistance routes require the person's legally sufficient involvement. CEO status alone does not prove an underlying offence or its authorization.

[Quebec Securities Act, historical source](#). Pre-2022 sources and the statutory appendix to Sharp were checked; this is not represented as a complete 2022 consolidation audit.

Wash trades — Criminal Code 382. For securities, the provision requires intent to create a false trading/price appearance and specified conduct: no-beneficial-ownership-change trades or knowingly matched purchase/sale orders. Repeated AMM transactions alone are insufficient to demonstrate those elements. Pool counterparties, routers, arbitrage and actual beneficial control must be distinguished. Section 380(2) separately addresses fraudulent means affecting market prices of a broader range of publicly offered property; it still requires fraudulent intent and a price effect. [Section 382](#); [section 380](#).

A Canadian nexus must be established from operations at the relevant time. Libman permits criminal jurisdiction where a significant part of offending activity creates a real and substantial Canadian connection, even with foreign victims. Sharp concerns Quebec regulatory jurisdiction over sufficiently connected outside actors, not a criminal conviction. Citizenship, a present address, a registrar's location or the complainant's location alone does not establish that operational connection. [Libman](#); [Sharp](#).

Laura's established role is relevant without inventing wallet ownership. Her dated promotional and operational statements can be evaluated directly. A case about knowingly misleading statements does not require her to possess a private key. A case alleging her insider sales or wash trades does require evidence linking her to the relevant conduct. The current shared administrator has not been attributed to her.

The AMF's 2017 Impak Finance decision illustrates that an ecosystem-use token could follow conditional offering and registration relief. It was issuer-specific, not a blanket exemption. High annualized token rewards alone do not establish usury, a loan or a guaranteed fiat return. [Impak decision, bulletin pages 184-189](#).

7B. The BVI issuer claim and the applicable dates

Archived terms claim GamiFi Limited was incorporated in the British Virgin Islands. That is a recovered company representation, not an independently verified corporate certificate. Governing-law wording does not by itself settle regulatory jurisdiction or classification. The analysis below applies conditionally to the identified issuer and activities. [Archived terms](#).

The 2022 investment-law question is about rights and business activity. The FSC's July 2020 guidance distinguishes pure payment/access utility from products carrying additional investment rights. A token's existence or staking APY alone does not establish an investment under SIBA. The recurring partner-offering business and percentage fee deserve closer classification than minting the issuer's own NFT in isolation. [FSC 2020 guidance](#).

SIBA licensing and deceptive inducements are separate routes. Section 4 addresses investment-business licensing, including its rule for BVI companies' overseas investment business. Schedules 1 and 2 define investments/activities and specified own-issuance exclusions. Section 91 concerns knowing/reckless investment inducements and intentional false market impressions, subject to its own in/from-BVI requirement and section 92 defences. Do not substitute incorporation alone for that territorial test. Section 19's misleading-advertising rule applies to licensees. The reviewed consolidation expressly excludes Part II from commencement; this report therefore does not found a 2022 prospectus accusation on that printed but excluded text. [SIBA consolidation](#).

The VASP regime started on 1 February 2023. Existing in-scope businesses had until 31 July 2023 to apply; timely applicants could continue pending determination. It cannot be applied retroactively to create a 2022 VASP-registration offence. [FSC commencement notice](#).

For later activity, the service definition matters. The VASP Act covers specified services conducted as a business for another person, including certain issuer-sale financial services, exchange and custody. NFT/DeFi terminology is not an automatic exemption or inclusion. Section 5 includes relevant holding-out by BVI companies; section 24 addresses knowing/reckless material misstatements by a VASP. An obsolete own-NFT page alone does not establish that an operator continued a regulated third-party launchpad. Senior-officer liability under section 46(2) requires knowing authorization, permission or acquiescence. Laura's replacement as CEO in September 2022 cannot automatically establish her conduct in 2023. [VASP Act; registration guidance](#).

The register search is bounded. Four current FSC VASP register pages, containing 57 displayed entries including repeated categories/representatives, returned no Gami match. This is neither a historical no-application certificate nor proof of unlawful operation. No relevant FSC enforcement notice was recovered in the stated search. [Current register](#).

Assessment: the legal work should focus on attributable material representations, the economic substance of the products, and actual regulated activity on the relevant dates. Token creation, high returns, stale sites and thin liquidity do not independently supply every element of a criminal trading scheme.

8. Archive coverage and evidence integrity

This collection is reproducible; it is not every page that ever existed. Indexes include errors, revisits, redirects and duplicate bytes. Inventories, raw responses, extracted text, comparisons and failures are retained so coverage can be checked.

Collection	Scope and recovery
Homepage	All 164 indexed mementos accounted for: 160 responses recovered, including 144 nonempty and 16 empty; four unavailable. Thirty requests returned different capture dates. Twelve substantive project-text versions identified.
Project-period index	1,506 records across 694 URLs through 2024; 972 status-200 records and 711 distinct successful payload digests. An independent collapsed index added no successful digest.
App	343 of 347 selected payloads: all 108 HTML and 157 JavaScript captures, plus 78 images. Four image failures retained.
Main-site assets	322 of 326 selected responses, including historical images, styling, scripts and litepapers. Four failures retained.
Communications	66 article IDs: 65 archived, one sitemap-only. All 633 indexed payloads attempted; 620 recovered (418/431 through 2023; 202/202 later). There are 622 saved receipts including duplicates, matching CDX. Bodies cover 64 archived IDs. RSS contains 39 episode descriptions.

Litepapers: complete archived originals dated November 15 and 18, 2021, January 22 and February 21, 2022. May 26 and October 7 responses contain only the first 1,048,576 bytes and are labelled partial. A complete CryptoCompare mirror matches the May fragment's available bytes and declared full length; its remaining bytes are mirror evidence. [Full supplemental copy](#).

New legal and chain evidence: legal_chain_followup preserves primary Canadian/BVI texts, detailed legal memos, pool reserves, farming custody, 24 consecutive historical blocks and 14,751 receipts. It includes full Mystery/Duke source and compiler inputs/outputs, exact live-bytecode validation and the read-only failed purchase simulation. Its README maps findings to files. Current supplies are not paid-sale counts or historical mint dates.

How to inspect: extract the ZIP and open START_HERE.html. Readable text accompanies archived HTML, which may retain external scripts/links. No adult media was collected. SHA-256 manifests detect later file changes; they are not notarization. Raw bytes, decoded copies and failed requests are distinguished.

Validation boundaries: arithmetic, capture/version differences, address bindings, matched code, selected state and the specified historical receipt window were checked. This is not a complete trading, treasury, refund or reward-payment ledger. No statistical trading backtest or artificial-volume percentage is claimed. Candidate code is not treated as deployed without a match.

Audit/registration: the claimed PeckShield report was not recovered. Blocked registration searches are not proof of non-registration. The BVI register review is a bounded current search, not a historical certificate. No certified corporate registry or purchaser file is included.

Collected 5 September 2026. COVERAGE.json, lane manifests and FILE_MANIFEST.json provide detailed counts, provenance and per-file hashes.
