

ShibaFriend claims review

Historical source edition | 7 September 2026

Public crypto research edition. The following material preserves historical analysis, source identifiers, transaction amounts and stated qualifications. Observations retain their original dates, principally 5-7 September 2026. Preparing this edition did not repeat the blockchain, corporate-registry or legal research.

Read each assertion with its cited source and limits. A public role, a wallet connection or a valid transaction does not by itself identify a human operator, prove personal receipt or establish wrongdoing. The reports distinguish findings, interpretations and unanswered questions.

Correction precedence: the 7 September 2026 ShibaFriend claims review reports repayment of the principal of all 23 non-dust funding addresses, with only 168 base units of dust unmatched. It also reports equal project matches for all 194 identified paid Mystery Box mints. Those later findings supersede earlier uncertainty about those specific questions. See [Research_Paper_ShibaFriend_Claims_Review.pdf](#).

Original source-page labels and reference identifiers are retained where useful. Gaps in numbering reflect the crypto-only scope. Historical references to companion records are locators; consult the repository inventory to see which records are included. Current availability of an external source is not guaranteed.

Laura Walsh / ShibaFriend

Further verification changes the assessment

| Revised 7 September 2026

The latest test supports Laura's Mystery Box matching promise. All 194 identified paid mints have equal buyer and project GMI transfers to the designated burn address. The official app identifies the sale contract, whose checked cap is 500. The company's article still conflicts internally between 1,000 and 500 boxes, but the matching promise is supported by execution evidence. [S30-S31]

The earlier positive repayment finding also stands: receipts cover the principal of all 23 SHF funding addresses with non-dust contributions. Direct funding connects the three individual payments to the administrative refund batch. [S14, S22]

The project also explicitly announced its token replacement, retained the older audited address in contemporary website code, and had an Android game listing before fundraising. These records weaken blanket allegations of a fabricated audit, nonexistent product or no follow-up. A demonstrable token-allocation arithmetic error, inconsistent audience labels and conflicting Mystery Box quantities remain. Knowing deception by Laura has not been established.

Thread tested	Revised finding	Investigative consequence
SHF principal repayment	23 addresses received matching or slightly larger payments; three unmatched dust stakes	Replace the broad unresolved-refund allegation with the exact payment ledger.
Two audited contracts	Issuer announced replacement; older address remained in June 20 code	Audit timing alone does not prove false advertising.
Token allocation	Whitepaper labels 100 million of 1 billion tokens as 1%	A confirmed tenfold percentage discrepancy needs explanation.
Personal follow-up	July 1 audio discusses SHF cancellation and renews legal-review claims	Compare her explanation with changed terms and actual repayment.
GamiFi Mystery Boxes	Cap 500; all 194 paid mints have equal project matches	Retain the publication error; matching-burn shortfall is not supported.

Laura's personally attributable assurance

At **11:17-11:43**, the AMA captions attribute to Laura analyst/legal review and rigorous project diligence, alongside acknowledgement that risk cannot be eliminated. At **40:23-41:11**, she discusses assessing the ShibaFriend team, mobile-game experience, execution and sustainability. These give a specific diligence claim to test. [AMA, S01]

This revision supersedes the prior settlement assessment in this claims review. It also corrects the audit inference using migration and code evidence. The separate original FOMO refund correction remains valid. Automatic captions are working evidence; disputed wording and speaker attribution should be checked against audio before formal quotation.

Principal payments located

GamiFi's June 29 cancellation notice offered a refund or an alternative SHF allocation with 1,000 GMI. The newly located transactions provide evidence of actual payments following that announcement. [Cancellation, S07; chain records, S14]

UTC date and time	Route	Addresses paid	BUSD
Jul 4, 22:04:53	e5d to 00be	1	100
Jul 5, 19:28:57	e5d to f4f2	1	111.2
Jul 12, 17:07:38	e5d to 86c9	1	53
Jul 13, 07:39:40	Admin address 3e0f through batch contract 4867	20	4,456.0316

All dates are in 2022. The July 13 batch is signed by the previously identified launchpad administrative address. Its 20 recipients are original funding addresses: 18 receive their exact aggregate contribution and two receive slightly more. The other three payments are exact contribution matches from original funder e5d. A further verified transfer links e5d directly to funding the administrative payout, as detailed on the next page. Its human operator and formal instructions remain unidentified.

Reconciliation	Result
Original funding	27 events, 26 addresses; 4,720.231567727363184247 BUSD
Located payments	4 transactions, 23 addresses; 4,720.2316 BUSD
Address-by-address outcome	21 exact; 2 rounded upward; 3 dust stakes unmatched
Total unmatched principal	168 base units = 0.000000000000000168 BUSD

The two upward differences total **0.000032272636815921 BUSD**. Excess paid to one address is not used to offset another address's shortfall. Each address is compared individually. The three unmatched dust amounts are 54, 14 and 100 base units; they are not a material investor-loss finding.

What is established: a directly attributable 20-recipient administrative payout, three additional exact payment matches and a verified funding link between their senders. The combined pattern is strong evidence of return of principal. The 4,720.23-BUSD withdrawal must no longer be presented as an unexplained unpaid loss.

All four successful payment receipts agree across two BNB Chain RPC providers. The 26-row ledger preserves original funding hashes, payment hashes, integer amounts and differences. [S14]

The refund routes connect

The sender of the three individual payments also supplied BUSD to the administrative address immediately before the large payout. This strengthens the return-of-principal interpretation beyond matching contribution amounts. [Fresh chain verification, S22]

July 13, 2022 UTC	Verified transfer	BUSD
07:21:49	e5d sends directly to administrative address 3e0f	4,457
07:39:40	3e0f pays the 20-address refund batch through 4867	4,456.0316

The interval is **17 minutes 51 seconds**. The first amount exceeds the second by **0.9684 BUSD**. These are independently verified successful token transfers, with identical receipts from both providers. The difference is arithmetic, not a measured remaining balance or an established fee or profit.

Individual payer / batch funder e5d

0xe5d5245dce768ef43f1c5fa9c96b7e1520d96dc8

Administrative address 3e0f

0x3e0f4c7bdbf9bcc4aa9f22b3d03048b3ef2d7199

The combined sequence strongly supports e5d's operational involvement in the same repayment process. Its three exact payments, totaling 264.2 BUSD, preceded the batch-funding transfer. Its own original contribution was also returned in the batch; that payment must not be counted a second time as a separate refund.

What this closes, and what it does not

The two payment routes are no longer merely an amount-matching coincidence: a direct transfer connects their senders. Formal instructions, accounting treatment and beneficial ownership still require records. A signing address cannot identify Laura or an employee by itself.

Historical balance calls on both queried providers returned missing-state errors. Consequently, this finding does not assert a complete intervening balance reconciliation or trace unique units through mixed balances. The observed transfer link and timing remain independently established.

Other payments from pooled address 35b to e5d recur before and after the cancellation period. A later payment cannot simply be labelled reimbursement without supporting accounting. [S22]

Audit and migration chronology

The June 9 GamiFi offer advertised an audited contract without identifying its address or report. Its contemporary archive confirms that wording preceded the June 14-17 funding window. [Offer and archive, S02-S03]

Date	Primary record	What it establishes
Dec 9, 2021	Tech-Audit BAR44509122021	Audit of contract A.
Jun 20, 2022	Archived project JavaScript	A remains in token configurations; B is absent.
Jun 22, 2022	Archived issuer tokenomics	Says contract link will be released on listing day.
Jun 23, 2022	Issuer update notice	Explicit replacement from A to B.
Jun 24, 2022	Tech-Audit BAR21724062022	Audit of B; application June 22.
Jun 27, 2022	Coinstore sale notice	Names B as the token address.

A - older audited SHF

0x2D4dF8a0e975E15eA443933AffB27aFe9395e2A8

B - replacement audited SHF

0x96baD480691FeE450598F3A6c144F09FA5DF950D

The issuer notice closes the relationship between the two addresses. The June 20 code strengthens the explanation that the original assurance concerned the older audited token. Embedded configuration is evidence of code content, not every ^{source} executed environment or GamiFi's accepted terms. [Audits, S04-S05; notice/code, S15-S16]

Revised assessment: the later audit date does not establish premature or fabricated audit advertising. The remaining request is the report, contract and tokenomics version supplied to buyers, followed by migration notification and any renewed consent.

Both audits concern specified token contracts and exclude application/product review. Neither verifies KYC or warrants investment quality. The June audit describes limits on minting, trading-disable and fee powers. Auditor KYC status does not disprove checks by another provider. A December project AMA names PinkSale.finance as its claimed KYC provider; the verification record remains to be obtained. [S04-S05, S21]

Promotional accuracy and changed terms

A confirmed allocation arithmetic error

The issuer's tokenomics page captured **June 22 at 04:42:23 UTC** states a total supply of **1 billion SHF**. Its public-sale row simultaneously shows: [Archived whitepaper, S17]

Field	Published value	Arithmetic check
Public allocation percentage	1.0%	1% of 1 billion is 10 million.
Public allocation tokens	100 million	Equals 10% of total supply.
Price and raise	\$0.0054; \$540,000	Raise matches 100 million tokens.

The percentage conflicts with the token count and raise. Listed allocation percentages sum to 91%; replacing the public row's 1% with 10% makes 100%. This is a demonstrable document error. It does not identify its author, Laura's approval, investor reliance or resulting loss.

The diligence question: which version was reviewed, and was this inconsistent revision shown to buyers? The capture is after GamiFi's funding window, so its error cannot automatically be attributed to the earlier review.

Changes were real; consent remains unverified

Oxbull's June 11 offering article described **10 billion supply**, with different allocation percentages. The June 22 issuer page specifies 1 billion and revised allocations. Both publish 18%/41%/41% public release percentages. This documents changes in published economics; it does not establish a tenfold investor loss. [Oxbull, S18; whitepaper, S17]

These records support the substance of GamiFi's June 29 explanation that tokenomics changes complicated the launch. Cancellation followed by principal payments must be considered when assessing its conduct. [S07, S14]

Audience labels remain inconsistent

GamiFi's June 9 notice described 7.4 million CoinMarketCap watchlists; its June 17 spotlight described 7.4 million CoinGecko followers. Different platforms and labels were attached to the same headline number. [S02, S08]

This needs dated analytics and correction history. It does not establish fabricated users or Laura's authorship. Current CoinMarketCap displays approximately 7M, providing scale context without verifying the 2022 count, unique people or active players. [S13]

Listing conditions and promotional wording

Coinstore's own notices differ

Directly readable exchange publications provide firmer evidence than the incompletely recovered Telegram messages. [Coinstore, S23-S24]

Publication	Published SHF access timetable	Market named
June 29 overview	Deposit June 30; 50% trading/withdrawals July 7; 100% July 14, each 09:00 UTC	SHF/BUSD
July 3 weekly recap	Trading June 30 at 08:00 UTC	SHF/USDT

These publications communicate different opening dates and pairs. Account categories and market scope need clarification before treating them as contradictory instructions to the same buyer. The June 29 overview also retains a 10-billion supply after the issuer's June 22 page gives 1 billion; outdated promotional copy is one possible explanation.

The discrepancy independently supports the plausibility of GamiFi's June 29 explanation that changes complicated the launch. It does not establish exactly which change triggered cancellation, when Laura learned of it, or which version each buyer accepted. [S07, S17, S23-S24]

Extra tokens are not an assured cash profit

Coinstore's June 27 offer describes a 50% additional SHF allocation for first-round buyers, deliverable within three working days of the event's end. Its July 3 recap instead uses the phrase **“minimum rate of return of 50%.”** [S06, S24]

The latter wording overstates what the stated benefit establishes. More token units do not guarantee their sale price, liquidity or a monetary profit. This is a documented exchange-promotion concern. The retrieved evidence does not show Laura authored, approved or repeated it.

Keep the unresolved Telegram lead separate

A search index retains descriptions of 30%/35%/35% vesting and a seven-day exchange lock followed by a no-lock update. Original post identifiers, full dates and edit history could not be recovered. The multi-message page suffix is not a verified individual-message permalink. Those snippets are not used here as an authenticated timed reversal.

Token vesting and exchange access are separate restrictions: removing an exchange lock does not release every unvested token. The required records are dated buyer terms, issuer instructions and exchange account-level restriction logs.

July 1 interview: testable statements

The original 32:12 podcast file was recovered and processed as a working transcript. A second model checked the decisive passages. Both support the substance below; speaker assignment follows conversational context. This is machine-assisted review, not a certified or listening-verified transcript. [Audio and method, S25]

Approximate timestamp	Attributed statement	Evidence comparison
01:25-02:05, Laura	SHF was cancelled because terms were unfavorable for the community; presents this as protection	Aligns with the cancellation notice and subsequent principal payments.
23:33-24:02, Laura	Describes substantial legal review, while distinguishing it from regulatory compliance	Obtain counsel's scope, dated findings and approval; this is not proof of a compliance certification.
17:00-17:58, Laura	25,000 GMI per box plus the project's equal match, sent for permanent removal from circulation	Company's following announcement confirms the per-mint matching promise.

Publication on July 1 establishes availability by that date. References to cancellation that morning and a coming demo day do not, by themselves, establish the recording date. The audio closes the earlier question of whether this interview addressed SHF; it does not prove the original diligence was performed as described.

Company copy conflicts on Mystery Box quantity

GamiFi's July 2 article, preserved July 3, opens with **1,000 boxes**, then describes **500 boxes, 25 million GMI** and rarity calculated over 500 NFTs. Its per-mint calculation remains **25,000 buyer + 25,000 project = 50,000 GMI**. [S26]

The podcast's 1,000-box / 50-million scenario was conditional on sales, not a claim that a burn had already happened. The article's internal quantity mismatch requires a dated correction or the actual launch configuration. A revised cap could explain different versions; it does not reconcile two quantities within this captured article without further records.

Fulfillment test now completed: the official archived app identifies the deployed sale contract. Its checked cap is 500, and 194 paid mints reconcile to 9.7 million GMI in equal buyer and project transfers. Six additional recipient-list mints have a different payment pattern. The following page gives the complete mint census and limits. This concerns GMI, separate from SHF principal. [S30-S31]

Mystery Box burns reconcile

The official app's JavaScript captured **August 2, 2022** identifies this Mystery Box contract alongside the established GMI token. This closes the attribution gap left by unverified developer copies. [S30]

Production Mystery Box contract

0x0169057ff42652f919456dce4424d9881daed399

Designated burn destination

0x0001

Mint category	NFT count	Buyer GMI / project GMI	Combined GMI
Paid purchases, 184 transactions	194	4,850,000 / 4,850,000	9,700,000
Recipient-list mints, 3 transactions	6	0 / 150,000	150,000
Total	200	4,850,000 / 5,000,000	9,850,000

Every paid mint carries **25,000 buyer GMI plus 25,000 project GMI** to the destination in the same successful transaction. The count includes multi-box purchases; transactions and NFTs are not interchangeable. All 200 mint IDs, 0-199, appear exactly once. Both RPC providers agree on all 190 transactions, receipts and decisive block fields, including three prefunding transfers. [S31]

At the pinned check on September 7, 2026, the contract reports a **500 cap, 200 minted** and **25,000-GMI price**. The observed mint history runs July 12, 2022-March 19, 2023. Later activity cannot automatically be attributed to Laura personally. These are transfers out of circulation, consistent with the stated soft-burn mechanism; they are not a reduction in ERC20 totalSupply.

What still requires explanation

The six recipient-list mints burn 25,000 each from the contract, with no buyer payment in those receipts. Giveaway promotions exist, but these exact recipients' eligibility has not been established. Therefore 200 multiplied by 50,000 would use an unsupported paid-mint denominator. The article's broader wording about every NFT minted warrants clarification; it does not establish an unpaid match on a purchase.

The deployed 500 cap supports the article's later calculation, while its opening 1,000 remains inconsistent. Public repository code is not byte-for-byte equivalent to the checked implementation; actual receipts and official app configuration ground this result. No paid matching-burn shortfall is demonstrated. [S26, S30-S31]

Testing a later burn claim

A GamiFi-branded graphic relayed in the project-named Reddit community claims five million GMI burned; the post says more than five million. The recovered post timestamp is **August 11, 2022, 04:48:21 UTC**. Community ownership and Laura's authorship are unverified, so this is a dated promotional relay rather than a personally attributable statement. [S32]

Cutoff	Paid / recipient-list NFTs	Verified GMI to burn address
At the August 11 post	108 / 0	5,400,000
Before September 1, 2022	129 / 4	6,550,000
Full observed mint history	194 / 6	9,850,000

The five-million claim is supported by the transaction history. At the exact posting time, 2.7 million GMI had come from buyers and an equal 2.7 million from the project contract. The extra 400,000 is not inferred from a current wallet balance: it is the cumulative sum of the verified transfers before that timestamp. [S31-S32]

Funding adds another operational link

Three transfers supplied **5 million GMI** to the sale contract. Of this, **750,000 GMI** came from e5d, the address already linked to SHF principal repayments; **4.25 million GMI** came from address 1f88 across two transfers. The sale contract subsequently supplied 4.85 million in paid matches and 150,000 for recipient-list mints. Those amounts reconcile exactly. [S31]

This strengthens e5d's operational connection to GamiFi beyond the SHF repayment sequence. It does not identify its human controller or establish Laura's control over that key. GMI token movements must not be added to the BUSD refund ledger as though they were the same asset.

Revised investigative position

The evidence supports a specific publication-accuracy challenge: why did the July article announce 1,000 boxes while also calculating over 500? It also supports asking whether the broader per-NFT burn wording excluded promotional mints. The records do not support converting these wording issues into a claim that paid purchasers were denied the promised match.

The exact public launch hour remains unverified. Dated promotional relays point to July 13, while an actual paid mint occurred July 12. Early access or testing could explain that timing; a prelaunch transaction is not itself evidence of misleading buyers. [S31-S32]

Cross-checking the project itself

Product evidence exists before fundraising

A Google Play page captured **May 8, 2022** lists **Shiba Music Beat**, developer ShibafriendNFT, updated May 3, version 6, size 58M and 10+ installs. Its description concerns a rhythm game and Diamond rewards. This establishes a contemporaneous app-store listing, beyond promotional screenshots. [Archived Google Play, S19]

It does not establish working cash-outs, sustained users, commercial football gameplay or all promised features. Android-only install counts cannot refute a later cross-platform player claim because the project had a browser-game route. No historical app was executed in this pass.

The June website bundle contains browser Music Beat, APK and 3D-viewer links, plus football models and promotional assets. Models and guides are not proof of a playable football game. The promised football release remains unverified; missing build evidence is not proof that no build existed. [S16]

Follow-up interviews actually happened

The publisher catalog records ShibaFriend interviews on **April 1 and June 17**, and a later Time Raiders interview on **July 20**. These support continuing project communication. A blanket allegation of no follow-up would conflict with the records. Interviews alone do not substantiate technical diligence or investor-specific accountability. [Publisher catalog, S20]

The July 1 Laura/Casey episode has now received machine-assisted review. It addresses SHF cancellation and gives additional legal-review and GMI matching-burn statements, examined in this report. [S25]

Team and partnership scope

An issuer team page captured September 29, 2022 directly links Alan Yeap to a December 2013 firsthand interview about IAWorkshop app/game training. This corroborates relevant earlier activity. It does not independently establish named shipped-game credits or show Laura reviewed those records before the offering. The later studio page also puts a biography naming Tuong Bui under Hoang Thanh; that is an editorial mismatch requiring clarification, not evidence of a fictitious employee. [S27-S29]

HYPE's materials corroborate its ShibaFriend association. Pilot selection must be distinguished from a full commercial licence or production rollout; GamiFi's recovered text already uses pilot language. Request the agreement and rights scope relied upon in promotion. [S02, S09-S10]

What remains open after repayment checks?

Investor elections and August token holdings

At BNB Smart Chain block **120,452,183**, both queried providers report these balances at **74f7**, exactly matching its two August 25, 2022 SHF receipts: [S14]

Token contract	Balance still at 74f7
Replacement SHF, B	85,733.882037037 SHF
Older SHF, A	9,166,666.666608 SHF

74f7

0x74f7a03ee449bbe36f2c8201348962657cf96ddc

Its public token index shows no onward SHF transfer; all 94 signed transactions form a complete nonce sequence ending before the August receipts. These balances do not prove refunded buyers were also owed tokens. The business purpose and beneficial ownership of this holding remain unresolved.

The promised 1,000 GMI accompanied the alternative SHF-allocation option. A bounded search found no exact bonus payment, but 11 of 26 histories were capped and a bundled payment would evade an exact-amount filter. **Bonus nonpayment has not been established.** Buyer elections determine whether that obligation arose.

The remaining records are now more specific

- **Payment instructions and accounting:** explain e5d's three direct payments and its 4,457-BUSD batch-funding transfer. Operational linkage is verified; formal authority, reimbursement and the human operator remain to be established.
- **Buyer version and consent:** connect the June offer, older audit, replacement notice and changed allocation to the information actually sent to buyers.
- **Diligence and approval:** identify the analyst, legal reviewer, dated review file, adverse findings and person who approved each claim or revision.
- **Delivery and rights:** obtain the football build/release record, earlier game credits, meaningful analytics and sports pilot/licence agreements.
- **Personal knowledge:** authenticated instructions, approvals or prior warnings are needed to establish a knowingly false claim by Laura. A title or unidentified signing key is insufficient.

Laura's separate MEXC PeckShield assertion concerns GMI, not these SHF audits. That report request remains separate. [S11]

Assessment: this follow-up found errors worth questioning and major evidence against broader allegations. It has not established that Laura fabricated the project, knowingly misrepresented its audit, or retained SHF contributors' principal.

Faster-whisper 1.2.1, small.en, English, CPU int8; base.en independently reprocessed the cancellation, legal-review and matching-burn passages. Names are imperfectly recognized, so no disputed verbatim quotation is presented. [Publisher player](#) | [Original audio](#)

S26 - GamiFi Mystery Box NFTs. Company article published July 2, 2022; exact capture July 3, 08:38:57 UTC. Per-mint match and conflicting box totals. [Archived publication](#)

S27 - Issuer team page. Exact capture September 29, 2022, 04:08:22 UTC; requested June date redirected here. The later capture is not evidence of what buyers saw in June. [Archived team](#)

S28 - Terence Lee / Tech in Asia interview. December 4, 2013, syndicated by Yahoo Finance; linked directly from S27. Documents IAWorkshop and reporter attendance at a preview class. [Interview](#)

S29 - Issuer studio page. Exact capture September 29, 2022, 04:33:05 UTC. Roster and name/biography mismatch. [Archived studio](#)

S30 - Official app deployment configuration. August 2, 2022, 06:51:30 UTC capture. Identifies Mystery Box 0169057, GMI 93d8 and Duke 3e5f. SHA-256 e513a89cb5fb4fade9d404cba2a3002c6f6eaea63d68a1cb11ac79042f275a0d. [Archived JavaScript](#). Two-provider pinned state and code-comparison limits are preserved in the evidence package.

S31 - Production Mystery Box transaction census. BNB Chain 56; 190 transactions, 200 mint IDs, 194 paid NFTs and six recipient-list NFTs. Equal paid matches verified independently from both providers' raw receipts. [First paid mint, July 12](#) | [Four recipient-list mints, August 25](#) | [e5d prefunding, July 11](#)

S32 - Dated promotional relays. Reddit community r/GamiFilaunchpad; brand graphic and post metadata inspected. Ownership and Laura attribution are not established. [August 11 five-million post](#) | [July 12 launch-date relay](#) | [August 23 giveaway-winner relay](#). URL, timestamp and source-byte provenance are packaged; empty archived Twitter shells are not treated as recovered tweet text.

Preservation: the package retains public-chain responses, our reconciliation, source URLs, timestamps and SHA-256 provenance. Full third-party articles, software and podcast transcription are research originals rather than redistributed content. Listening verification remains necessary before formal audio quotation or disputed speaker attribution.
